A book distinctively for students. It embraces both the experimental and theoretical aspects of sound. The various typical musical instruments are discussed from the view-point of the physicist. The book covers the whole subject for examination purposes, and by its illustrations and exercises ranks as a useful classbook.

The Conservation of Energy, being an Elementary Treatise on Energy and its Laws. By Balfour Stewart. 180 pages. Illus. Kegan Paul. 5s.
In this book the universe is regarded as a thing composed of atoms, with some sort of medium between the atoms as the machine, and the laws of energy as the working of this machine. Treats, in simple language, of the transmutations of energy, its conservation and dissipation, and life as dependent upon the sun.

Natural Sources of Power. By Sir Robert Ball. 348 pages. Illustrated. Constable .. .. 6s. net
Water power and methods of measuring, and application to driving of machinery; various types of turbines and construction of water-power plants; wind-pressure and methods of measuring; the application of wind-power to industry; the construction of modern windmills, and the cost of power generated by them.

Dynamics. By Peter Guthrie Tait. 373 pages. Black .. .. 7s. 6d.
Reproduced from a contribution by the late Professor Tait to the "Encyclopædia Britannica," and extended to be a general introductory survey of the subject for students. The mathematics used are beyond the range of the general reader.

Elementary Mechanics. By G. Goodwill. 200 pages. Clarendon Press .. .. 4s. 6d.
Professor Carey, of Liverpool University, writes an introduction to this book, in which he says it recasts the order in which the subject of mechanics is presented to the student, and also widens the range of the subjects usually presented. It is based on experimental work; it introduces simple experiments which help the student to understand the fundamental notions of mechanics, and in many ways shows a most helpful originality.

Petroleum: the Motive Power of the Future. By W. S. Tower and John Roberts. Hodder & Stoughton .. .. 6s.
A history of petroleum since its discovery, and a portrayal of the importance of the part it plays in everyday life. It is written in non-technical terms for the general reader and is adequately illustrated.

Experimental Science. By G. M. Hopkins. (Spon.) 21s.

Text Book of Physics. By H. E. Hurst and R. T. Lattey. (Constable.) 8s. 6d. net.

Primer of Physics. By Prof. B. Stewart. (Macmillan.) 1s.

Lessons in Elementary Physics. By Prof. B. Stewart. (Macmillan.) 4s. 6d.

Text Book of Physics. By J. H. Poynting and Sir J. J. Thomson. (Griffin.) 4 vols.
Vol. I., Properties of Matter. 10s. 6d.
Vol. II., Sound. 8s. 6d.
Vol. III., Heat. 15s.
Vol. IV., Electricity and Magnetism, 10s. 6d.

Practical Physics. By R. T. Glazebrook and W. N. Shaw. (Longmans.) 7s. 6d.

Lessons in Elementary Practical Physics. By Prof. B. Stewart and W. W. H. Gee. (Macmillan.) 6s.

An Elementary Course of Physics. Edited by R. J. C. P. Aldous. (Macmillan.) 7s. 6d.

Theory of Heat. By J. C. Maxwell. (Longmans.) 4s 6d.

Heat. By P. G. Tait. (Macmillan.) 6s.

Radio-Active Transformations. By E. Rutherford. (Constable.) 16s. net.

Entropy. By J. Swinburne. (Constable.) 4s. 6d. net.

The C. G. S. System of Units. By J. D. Everett. (Macmillan.) 5s.

The Measurement of High Temperatures. By G. K. Burgess and H. le Chatelier. (Chapman & Hall.) 17s. net.

Reflections on the Motive Power of Heat. By N. L. S. Carnot. Translated by Prof. R. H. Thurston. (Chapman & Hall.) 6s. 6d. net.

Thermo-Dynamics of the Steam-Engine and Other Heat Engines. By Prof. C. H. Peabody. (Chapman & Hall.) 21s. net.

Technical Thermodynamics. By Dr. G. Zeuner. (Constable.) 2 vols. 36s. net.

Text Book of Thermodynamics. By J. R. Partington. (Constable.) 14s. net.

The Energy Chart. By Captain H. R. Sankey. (Spon.) 7s. 6d. net.

Superheat, Superheating, and Their Control. By W. H. Booth. (Constable.) 6s. net.

Liquid and Gaseous Fuels. By V. B. Lewes. (Constable.) 6s. net.
Fuels, Solid, Liquid, and Gaseous. By H. I. Phillips. (Lockwood.) 2s.
Oil Fuel. By E. Butler. (Griffin.) 7s. 6d. net.
Liquid Fuel and Its Combustion. By W. H. Booth. (Constable.) 24s. net.
Gas Producers for Power Purposes. By W. A. Tookey. (P. Marshall & Co.) 1s. net.
How to Manage a Suction Gas Producer. By W. A. Tookey. (P. Marshall & Co.) 1s. net.
Suction Gas Plants. By Prof. C. A. Smith. (Griffin.) 5s. net.
Producer Gas. By J. E. Dowson. (Longmans.) 10s.
Fuel, Water, and Gas Analysis. By J. B. C. Kershaw. (Constable.) 8s. net
Dynamometers. By Rev. F. J. Jervis Smith and C. Vernon-Boys. (Constable.) 14s. net.
Dynamometers, and the Measurement of Power. By J. J. Flather. (Chapman & Hall.) 12s. 6d. net.

Prime Movers

Manual of the Steam Engine and Other Prime Movers. By Prof. Rankine. (Griffin.) 12s. 6d. net.
Text Book on Steam and Steam Engines. By A. Jamieson. (Griffin.) 10s. 6d.
Handbook of the Steam Engine. By H. Haeder and H. H. Powles. (Lockwood.) 7s. 6d. net.
The Steam Engine. By Sir G. C. V. Holmes. (Longmans.) 6s.
Steam Engine Theory and Practice. By W. Ripper. (Longmans.) 9s.
Steam, Gas, and Oil Engines. By Prof. J. Perry. (Macmillan.) 7s. 6d net.
The Marine Steam Engine. By R. Sennett and Sir H. J. Oram. (Longmans.) 21s.
Manual of Marine Engineering. By A. E. Seaton. (Griffin.) 28s. net.
Marine Engines and Boilers. By Dr. G. Bauer. (Lockwood.) 25s. net.
Engine Room Practice. By J. G. Liversedge. (Griffin.) 6s. net.
Pocket Book of Marine Engineering Rules and Tables. By A. E. Seaton and H. M. Rounthwaite. (Griffin.) 8s. 6d.
Treatise on the Richards Steam Engine Indicators. By C. T. Porter. (Spon.) 9s.
The Indicator Handbook. By C. N. Pickworth. (Whittaker.) 2 vols. 3s. each net.

STEAM TURBINES

Steam Turbine Engineering. By T. Stevens and H. H. Hobart. (Spon.) 21s. net.
Steam Turbine. By R. M. Neilson. (Longmans.) 18s.
Theory of the Steam Turbine. By A. Jude. (Griffin.) 18s. net.
Marine Steam Turbines. By Dr. G. Bauer. (Lockwood.) 10s. 6d. net.
The Flow of Steam Through Nozzles and Orifices. By A. Rateau. (Constable.) 4s. 6d. net.
Steam Turbines. By Dr. A. Stodola. Translated by Dr. L. Loewenstein. (Constable.) 21s. net.
Evolution of the Parsons Steam Turbine. By A. Richardson. (Offices of "Engineering.") 21s.
Design and Construction of Steam Turbines. By H. M. Martin. (Offices of "Engineering.") 25s. net.

STEAM BOILERS

Steam Boilers. By H. H. Powles. (Constable.) 24s.
Boilers, Economisers, and Superheaters. By Prof. R. H. Smith. (Lockwood.) 7s. 6d. net.
Steam Boilers. By R. D. Munro. (Griffin.) 4s. 6d.
Marine Boiler Management and Construction. By C. E. Stromeyer. (Longmans.) 12s. 6d. net.
Marine Boilers. By L. E. Bertin. (John Murray.) 415 pages. 21s. net.

LOCOMOTIVES

British Locomotives. By C. J. B. Cooke. (Whittaker.) 6s. net.
Manual of Locomotive Engineering. By W. F. Pettigrew. (Griffin.) 21s.
Locomotive Compounding and Superheating. By J. F. Gairns. (Griffin.) 8s. 6d. net.
Construction of the Modern Locomotive. By G. Hughes. (Spon.) 9s.
Modern British Locomotives. By A. T. Taylor. (Spon.) 4s. 6d. net.

Quantities. By Prof. B. Fletcher. (Batsford.) 7s. 6d.

NATURAL HISTORY

Botany

Hutchinson's Popular Botany. By A. E. Knight and E. Step. Two vols. Hutchinson. 15s. net
These handsome volumes, with coloured plates and a host of illustrations from photographs, form an admirable popular introduction to the subject. The living plant, from seed to fruit, is dealt with in a truly scientific way.

The Natural History of Plants. By Anton Kerner. Two vols. Illustrated. Blackie .. .. 30s. This work is unique in that, while accepted by botanists as authoritative, it at the same time makes plant life in its myriad forms a fascinating subject for the general reader It deals with the form and life of plants, the living principle, absorption of food, formation of organic matter, metabolism, growth and construction; also with the history of plants, their propagation, and the origin, variation, and extinction of species. There are many excellent plates.

Plant Geography. By A. F. W. Schimper. Clarendon Press .. .. .. 42s. net This study of "plant-geography upon a physiological basis," written by a German professor, shows the relations of different kinds of plants, and their structure and habits, to the conditions of climate, altitude, and soil in various regions of the world. It is a fascinating work; and the illustrations, chiefly from photographs of tropical, desert, temperate, Alpine, and other scenes of vegetation, are of unusual interest. The bibliography is excellent.

The Student's Botany. By S. H. Vines. 821 pages. Illustrated. George Allen & Unwin .. 15s. A conscientious review of the whole field of botany. The work is divided into four parts, dealing respectively with morphology, cells and tissues, classification, and physiology of plants. It is designed for the use of the student who is preparing for an examination, rather than for the lover of trees and plants.

Plant Life. By Grant Allen. 232 pages. Illustrated. Hodder & Stoughton .. .. .. 1s. net A popular account, meant for men and women, not for children, of the activities of plant life in the light of the evolutionary theory.

Botany of Today. By G. F. Scott Elliot. 352 pages. Illustrated. Seeley .. .. .. 5s. net An account of recent discoveries, written in a fresh, open-air spirit. Deals with a great variety of subjects—*e.g.*, bacteria, deserts, tropical forests.

The Romance of Plant Life. By G. F. S. Elliot. 380 pages. Illustrated. Seeley .. .. 5s. Deals vividly with the most interesting aspects of plant life in every part of the world. A great variety of subjects, treated with wide learning.

Manual of British Botany. By C. C. Babington. 632 pages. Gurney & Jackson .. .. 9s. A standard work, revised in the light of modern researches. Contains the flowering plants and ferns arranged according to the natural orders. Intended as a field-book for botanists.

Handbook of British Flora. By George Bentham. Revised by Sir J. O. Hooker. Lovell Reeve. 9s. net This long-lived handbook, being a description of the flowering plants and ferns indigenous to the British Isles, is designed for the use of the beginner or amateur. It is very highly condensed, and is dry as dust, but has the advantage of being also full and trustworthy.

Ancient Plants. By Marie C. Stopes. 198 pages. Illustrated. Blackie .. .. .. 4s. 6d. net A simple account of the past vegetation of the earth and of the recent important discoveries made in this realm of Nature-study. Includes an examination of the minute structure of fossil plants, and of their resemblance to, and differences from, living ones; also a study of the past history of the various plant families. An attractive book for the younger student who is genuinely interested in evolution.

British Plants: Their Biology and Geology. By J. F. Bevis and H. J. Jeffery. Rivers. 4s. 6d. A general survey of the British flora, its evolution and distribution. A useful book, not so advanced or technical as to be beyond enjoyment by the ordinary reader.

Plant Life on Land. By F. O. Bower. 172 pages. Illustrated. Cambridge University Press. 1s. net A series of apparently disconnected essays on various phases of plant life, but really arranged to follow in a general way the evolutionary history of plants, so as to show the importance of the relation of the plant to water, and the migration of plant life from water to the land.

Studies in Fossil Botany. By D. H. Scott. 684 pages. Illustrated. Black .. 10s. 6d. net A companion volume to the author's "Introduction to Structural Botany." These studies are particularly concerned with the morphological and evolutionary aspects of the botany of earlier ages, and they are drafted in harmony with the newest results of scientific research.

The Evolution of Plants. By Dukinfield Henry Scott. Illustrated. Williams & Norgate. 1s. net A study of variation, as shown in both fossil and existing plants, pointing out especially the influence of insect life in producing modifications in forms,

Links with the Past in the Plant World. By A. C. Seward. Cambridge University Press .. 1s. net An inquiry into the relative antiquity of existing plants, as shown by the records of the rocks. A few selected plants of pre-eminently ancient types are described—ferns, the sequoia, the auraucaria family, and the maiden-hair tree of China and Japan. The geographical and geological distribution of plants and their preservation as fossils are treated.

The Origin of Floral Structures through Insect and Other Agencies. By Rev. George Henslow. 349 pages. Illustrated. Kegan Paul .. 5s. Mr. Henslow claims to suggest in this book how "the whole floral world has arisen." He refers every part of the structure of flowers to some one or more definite causes arising from environment, taken in its widest sense. In his preface he gives a useful summary of similar studies up to 1888.

The Origin of Cultivated Plants. By Alphonse de Candolle. 468 pages. Kegan Paul .. 5s. An interesting book, tracing the origin of almost all plants cultivated either on a large scale for economic purposes or in orchards and kitchen-gardens. The author has endeavoured to establish the number of centuries or thousands of years during which each species has been in cultivation, and how its culture spread in different directions at successive epochs. Histories of 249 plants are investigated.

The Geological History of Plants. By Sir J. William Dawson. 290 pages. Illus. Kegan Paul. 5s. The object of the writer is "to give in a connected form a summary of the development of the vegetable kingdom in geological time." Born in a district rich in fossil plants, he began as a boy the study summarised in this book, and continued it for nearly half a century. The way is made easy in an introductory chapter by a geological chronology.

The Movements and Habits of Climbing Plants. By Charles Darwin. Illustrated. John Murray. 2s. 6d. Plants do not differ from animals merely in power of movement. They display this power only when it is of some advantage to them. The capacity of revolving, on which most climbing plants depend, is inherent in an undeveloped state in almost every plant. Deals with twining plants, leaf-climbers, tendril-bearers, and hook and root climbers.

The Various Contrivances by which Orchids are Fertilised by Insects. By Charles Darwin. 300 pages. Illustrated. John Murray .. 2s. 6d. net
Showing that the contrivances by which orchids are fertilised are as varied and almost as perfect as any of the most beautiful adaptations in the animal kingdom. Darwin also points out that these contrivances have for their main object the fertilisation of flowers with pollen brought by insects from a distinct plant.

Æcology of Plants : An Introduction to the Study of Plant Communities. By Eugen Warming. 433 pp. Clarendon Press .. .. .. 12s. 6d. net
Shows how plants or plant communities adjust their forms and modes of behaviour to the amounts of available water, heat, light, nutriment. Deals with the communal life of organisms, partnership between plants and animals or plants and plants, and the struggle between plant communities. Examines the plants that flourish in specific soils.

The Different Forms of Flowers on Plants of the Same Species. By Charles Darwin. 352 pages. Illustrated. John Murray .. .. 7s. 6d.
Certain kinds of plants produce in a normal way differently formed flowers on the same stock. Inquiry into this problem leads to the question why the sexes of flowers were separated. Darwin concludes it was not for the sake of the advantages to be gained by cross-fertilisation, but to reduce the number of seeds born by a plant, and save its vital energies.

The Physiology of Plants. By W. Pfeffer. Three vols. Illustrated. Clarendon Press.. £2 15s. net
A complete account of the present state of our knowledge concerning the general processes of nutrition and growth and the sources of energy in plants. Too large and detailed a work for beginners, but a valuable storehouse of facts.

Insectivorous Plants. By Charles Darwin. 461 pages. Illustrated. John Murray .. 2s. 6d. net
Largely a study of the behaviour of the common sundew, with experiments on making the tentacles fall by touching them or letting water fall on them; nature of the acid by which the plant digests insects; effects of various salts and poisons on the plant; the structure and movements of other insect-eating plants; and so on.

Organography of Plants. By K. Goebel. Edited by I. B. Balfour. 2 vols. Clarendon Press. 31s. net
A study of the configuration of plants regarded as a part of their life phenomena. Treats of the organs and divisions of labour among the lower plants; differences in the formation of organs at different stages of development; the influence of external stimuli on the shape of plants. Too technical a work for the general reader, but a first-hand source of information of great interest.

Nervation of Plants. By Francis George Heath. Illustrated. Williams & Norgate. .. 3s. 6d. net
This book is a study, in popular language, of the cell-tissues of the different parts of plants. Cell contents; colouring matter; protoplasm; the conditions of vital force; assimilation; breathing; the influence of light; evolution; autumnal metamorphosis, are some of the fascinating questions that are dealt with.

On Seedlings. By Lord Avebury. 288 pages. Illustrated. Kegan Paul .. .. .. 5s.
The book includes the parts of most general interest of a large, two-volume work entitled "A Contribution to our Knowledge of Seedlings." It is an examination of the forms of cotyledons, and the fact that they differ from the subsequent leaves.

Studies in Seeds and Fruits. By H. B. Guppy. 528 pages. Williams & Norgate .. .. 15s. net
An interesting treatise on the processes of germination, the result of many years' original researches and experiments. The results of these untiring researches extend far beyond the immediate problems of plant life. They indicate a range of adaptability in the seed much greater than the range of conditions prevailing on the earth, from which discoveries the author proceeds to theories of cosmic evolution suggested by them. A book full of suggestiveness and very stimulating. The experiments have been conducted by exhaustive weighing, drying, and swelling of seeds in the rest stage.

Flowers of the Field. By C. A. Johns. Revised. 378 pages. Illustrated. Routledge. 7s. 6d. net
A well-known work of a popular nature, revised by a modern botanist. The book beloved of ordinary lovers of flowers, because it is free from bewildering technicalities, and is simple in style. An introduction to British botany, with sufficient information to enable the beginner to make the best use of the text of the book. Has 96 coloured illustrations.

Wild Fruits of the Countryside. By F. E. Hulme. 212 pages. Illustrated. Hutchinson .. 5s. net
A beautiful pocket-manual, including 36 coloured illustrations and 25 from photographs, enabling the amateur to identify all kinds of fruits.

Wayside and Woodland Blossoms. By Edward Step. Two vols. Illustrated. Warne .. 12s. net
A pocket-guide to British wild flowers for the country rambler. Clear descriptions of 760 species, with coloured figures of 257 species.

Wayside and Woodland Trees. By Edward Step. Illustrated. Warne .. .. .. 6s. net
A pocket-guide to the British Sylva, with 175 plates reproduced from original photographs of living trees and shrubs, and 50 figures in the text of leaf, flower, and fruit.

British Trees, By C. A. Johns. Routledge. 7s. 6d.
A standard work, revised by modern authorities and embellished with many plates in colour. Deals with the forest trees of Britain and the exotic or hybrid trees and shrubs which have been introduced into the English garden.

Wayside and Woodland Ferns. By Edward Step. Illustrated. Warne .. .. .. 6s. net
A pocket-guide to the British ferns, horse-tails, and club-mosses, with plates in colour of all the species, and, in addition, Nature-photographs of the growing plants. Very handy.

British Ferns and Where Found. By E. J. Lowe. 167 pages. Illustrated. Allen & Unwin. 1s.
This book, in the Young Collector series, names and describes the British ferns, and tells the districts where each is to be found. A useful compilation.

British Ferns and their Varieties. By Charles T. Druery. Illustrated. Routledge. .. 7s. 6d. net
An admirable book at the price, with 40 coloured plates and 400 other illustrations. Gives the life history of ferns, their propagation, culture, and selection; fern foes and remedies; the finding of wild sports. The descriptions of varieties and species are arranged in alphabetical order.

British Plant Galls. By E. W. Swanton. 287 pages. Illustrated. Methuen .. .. 7s. 6d. net
A volume devoted entirely to the curious excrescences on leaves, giving interesting life histories of the gall-causers—wasps, saw-flies, beetles, moths, flies, eel-worms, and fungi. Many galls are depicted in colour, together with the insects that cause them. A pleasant and instructive work on an out-of-the-way yet important subject.

An Introduction to Structural Botany. By D. H. Scott. Two vols. Black .. .. 3s. 6d. each
A general introduction to botany, written with lucidity and freshness.

A Textbook of Fungi. By George Massee. 427 pages. Illustrated. Duckworth .. 6s. net
Describes the surprising increase in recent years in our knowledge of fungi. Deals with the structure, functions, pathology, and classification of these humble growths, the fixation of nitrogen, the colours of fungi, and experiments on them with poisons, radium, and X-rays.

Fungi and How to Know Them. By E. W. Swanton. 210 pages. Illustrated. Methuen .. 6s. net
This book contains descriptions of all the larger fungi—that is, of those which can be identified without the aid of a microscope. The first part deals with growth, parasitism, spore dispersal, etc. The second part contains full descriptions of the species figured in the plates. The plates, many of which are beautifully coloured, contain illustrations of nearly two hundred species. There are analytical keys to the genera, and instructions for the collector.

British Fungi, with a Chapter on Lichens. By George Massee. 551 pages. Illus. Routledge. 7s. 6d. net
The primary object of this book is to enable the reader to determine the names of our native mushrooms and toadstools. Describes where and how to find the fungi; the difference between edible and poisonous kinds; and the diseases caused by these lowly vegetable growths.

New Creations in Plant Life: An Authoritative Account of the Life and Work of Luther Burbank. By W. S. Harwood. Illus. Macmillan 7s. 6d.
A picturesque description of the new kinds and new varieties of fruits, flowers, plants, and vegetables created by Mr. Burbank. Explains the methods by which the results have been achieved, so that the reader may undertake experiments.

The Alpine Flora. By Henry Correvon and Philippe Robert. 436 pages. Illus. Methuen. 16s. net
This book contains 180 coloured plates from water-colours of extreme beauty. A general account of Alpine plants and their characteristics is given, and the methods by which they may be acclimatised in gardens are described. The various species are characterised, with the treatment which they require in gardens. An account is also given of the chief Alpine gardens in England and abroad. A truly delightful book.

The Natural History of the Bible. By Canon Tristram. Illustrated. S.P.C.K. .. .. 3s. 6d. net
A learned review of the physical geography, geology, and meteorology of Palestine, with a description of every animal and plant named in the Bible. The book includes an index of the texts of Scripture in which the animals and plants are mentioned.

The Universe. By F. A. Pouchet. 576 pages. Illustrated. Blackie .. .. 7s. 6d.
This handsomely illustrated volume on "the infinitely great and the infinitely little" is an admirable popular treasury of facts relating to animals and plants of all kinds and in all parts of the world. A really sound book to give to a boy or a girl.

Plant Life. By Professor J. B. Farmer. Williams & Norgate .. .. 1s. net
A study of some of the salient features of plant form from the point of view of function, so as to note the general nature of the causes that bring about the marvellous beauty and adaptedness of the vegetable kingdom.

Manual of British Grasses. By W. J. Gordon. (Simpkin, Marshall.) 6s. net.
Common Weeds of the Farm and Garden. By H. C. Long. (Smith, Elder.) 6s. net.
Diseases of Cultivated Plants and Trees. By G. Massee. (Duckworth.) 7s. 6d. net.
Diseases in Plants. By H. Marshall Ward. (Macmillan.) 7s. 6d.
Standard Fungicides and Insecticides in Agriculture. By G. F. Strawson. (Spottiswoode.) 1s. 6d.

Microscope

Microscopy. By Edmund J. Spitta. Illustrated. John Murray .. .. 12s. 6d. net
An admirable work on the construction, theory, and use of the microscope, designed to give students a complete understanding of the principles and possibilities and the effects of the instrument. A book to which students may turn with confidence.

Practical Microscopy. By F. S. Scales. 334 pages. Illustrated. Baillière .. .. .. 5s. net
A revised and extended edition of a useful book for beginners in microscopic work. Has chapters on the choice of a microscope and the accessories needed. Very good in the manipulation of the instrument, providing the practical information and advice that amateurs want.

How to Use the Microscope. By Rev. C. A. Hall. 88 pages. Illustrated. Black .. .. 1s. 6d.
This is a delightful and thoroughly practical little book for Nature lovers who desire to become acquainted with the microscope. It explains how a dissecting microscope may be extemporised, and how the author made a compound instrument with very little expense.

The Microscope. By Jabez Hogg. Illustrated. Routledge .. .. 10s. 6d.
An all-round book on the subject. It gives the history of the invention and its improvements, and deals very clearly with the practical use of the microscope and its accessories. In the second part there are useful descriptions of the commoner objects of microscopic study.

Evenings at the Microscope. By P. H. Gosse. Revised by J. Bell. Illustrated. S.P.C.K. 5s.
A well-known introductory work to the microscopic study of life, by a brilliant naturalist of the old school. Researches among the minuter organs and forms of animal life. It has been brought up to date by Professor Bell, and many new facts and illustrations have been added.

Zoology

Cambridge Natural History. Edited by Dr. S. F. Harmer and A. E. Shipley, F.R.S. 10 vols. Macmillan .. .. .. 17s. net each volume
A work of the widest possible range, dealing with life from protozoa to mammalia, with authority and full acquaintance with the latest scientific developments. Each branch of zoology is committed to an expert, and the result is a series of scientific works comprehensive, exact, and original. Each volume is copiously and handsomely illustrated, and separately indexed, so that it can be bought separately. Together, the ten volumes make the most complete survey of natural history.

VOL. 1. Protozoa, Porifera (sponges), Cœlenterata and Ctenophora, Echinodermata.

VOL. 2. Flatworms and Mesozoa, Nemertines, Threadworms and Sagitta, Rotifers, Polychæt Worms, Earthworms and Leeches, Gephyrea and Phoronis, Polyzoa.

VOL. 3. Molluscs, Recent Brachiopods, Fossil Brachiopods.

VOL. 4. Crustacea, Trilobites, Introduction to Arachnida and King-Crabs, Eurypterida, Scorpions, Spiders, Mites, Ticks, Tardigrada (Water-Bears), Pentastomida, Pycnogonida.

VOL. 5. Peripatus, Myriapods, Insects. Part I., Introduction, Aptera, Orthoptera, Neuroptera, and a portion of Hymenoptera (Sessiliventres and Parasitica).

VOL. 6. Hymenoptera (Tubulifera and Aculeata), Coleoptera, Strepsiptera, Lepidoptera, Diptera, Aphaniptera, Thysanoptera, Hemiptera, Anoplura.

VOL. 7. Hemichordata, Ascidians and Amphioxus, Fishes.

VOLS. 8, 9, 10. Amphibia and Reptiles, Birds, Mammalia.

Popular Natural History. By Rev. J. G. Wood. 444 pages. Illustrated. Routledge .. 5s.
A favourite popular work on animal life, by a writer with a lively style. The species are described in systematic order, and the arrangement of the various links in the chain of animated Nature is explained. A pleasant introductory work, and useful to the general reader for reference.

Natural History. By Richard Lydekker and others. 771 pages. Illustrated. Hutchinson .. 5s.
A wonderful book for the price, containing an almost incredible amount of information by eight or nine authors, each one of whom is a recognised authority and original investigator.

Geographical Distribution of Animals. By Alfred Russel Wallace. Two vols. Macmillan. £2 2s.
One of the monuments of modern biology. Contains a study of the relations of living and extinct animals bearing on the question of the past changes in the surface of the earth. The work is written in lucid language.

The Geographical and Geological Distribution of Animals. By Angelo Heilprin. Kegan Paul. 5s.
The author seeks "to give his readers such of the more significant facts connected with the past and present distribution of animals as may lead to a proper conception of the relations of existing faunas; to furnish a work of general reference, wherein the most salient features of the geography and geology of animal forms can be readily found."

The Animal World. By F. W. Gamble. 255 pages. Williams & Norgate .. .. .. 1s. net
With an introduction by Sir Oliver Lodge. Professor Gamble, of the Birmingham University, sets forth the leading facts and principles of animal life.

Zoology. By A. E. Shipley and E. W. MacBride. Cambridge University Press .. 12s. 6d. net
This excellent textbook is designed for students who have no previous knowledge of the subject, and all technical terms are carefully explained. The authors treat animals as living creatures, and not only as dead bodies.

Reptiles, Amphibia, and Fishes. By J. T. Cunningham and others. Illus. Methuen. 10s. 6d. net
The life story of reptiles, amphibia, fishes, and the lower chordata—"those primitive growths which lie at the foundations of the great houses of the vertebrates"—is here told by well-known specialists. Richard Lydekker writes on reptiles; Mr. Cunningham and Dr. Boulenger on amphibia; Mr. Cunningham on fishes; and Professor J. A. Thomson on the lower forms.

Primitive Animals. By Geoffrey Smith. 156 pages. Illustrated. Cambridge University Press. 1s. net
A simple account of modern views on the relationship of the chief groups of the animal kingdom, and an outline of the evidence on which the latest classification is based.

Outlines of Zoology. By J. Arthur Thomson. 875 pages. Illustrated. H. Froude .. 12s. 6d.
A manual for students. Gives a general survey of the animal kingdom, discusses in detail the structures and functions of animals, and the forms of vanished life recorded in the rocks and sands. Deals with the doctrine of descent, and then examines each order of animal life from the minute one-cell organism to man.

Animal Life: Its Natural Conditions of Existence. By Karl Semper. Illustrated. Kegan Paul. 5s.
The author enters upon an investigation of how variability in animal organisms is brought about by their surroundings. First he deals with inanimate surroundings—food, light, temperature, water at rest and in motion, atmosphere at rest and in motion—and then he considers living surroundings—the influence of living organisms on life and structure.

The Colours of Animals, Their Meaning and Use. By E. B. Poulton. Illustrated. Kegan Paul 5s.
Treats more particularly of the colours of insects. Shows the utility of colour and marking in animals, and gives reasons for supposing that the results have mainly been achieved by natural selection in the struggle for life. Protective resemblances, aggressive resemblances, warning colours and protective mimicry, and courtship colours are discussed.

Industries of Animals. By Frederick Houssay. 258 pages. Illustrated. Walter Scott .. 3s. 6d.
A book of fact which rivals fiction, describing the marvellous activities in humble creation, with chapters on animals that hunt, fish, and go to war; animals that provision themselves against rainy days, and build up societies; animals which make ingenious dwelling-places, and carry out defensive and sanitary work.

Animal Locomotion: or, Walking, Swimming, and Flying. With a Dissertation on Aeronautics. By J. Bell Pettigrew. Kegan Paul .. .. 5s.
Explains in simple language some of the difficult problems in animal mechanics—how legs move by the force of gravity; the locomotion of horse, ostrich, and man; the swimming of animals and fishes, and the action of the wings of birds and bats. Has a chapter on the balloon, on artificial wings, and the nature of the forces required to propel them.

Animal Intelligence. By George J. Romanes. 498 pages. Kegan Paul .. .. 5s.
One of the classics of the Darwinian theory. Deals with the animal mind from the point of view of evolution, and in connection with the growth of the human faculties. Begins with the lowest animals, treats of insects, fishes, reptiles, birds, and mammals, and the domesticated beasts. Interesting and clearly written book.

Animal Mechanism. By E. J. Marey. 283 pages. Illustrated. Kegan Paul .. .. .. 5s.
A pioneer work by a master-hand, who designed the instruments by which his discoveries were made. Marey applied the new method of instantaneous photography to the study of galloping horses and running men. He measured the wing-beats of insects by the sounds they made, and examined the muscular efforts that produced the to-and-fro movements of their wings.

The Mason Bees. By J. Henri Fabre. Hodder & Stoughton .. .. 6s. net
This volume contains not only all Fabre's essays on the Mason Bees, but also some miscellaneous papers—as, for example, one on cats—so as to make the edition of the works of Fabre published by Messrs. Hodder & Stoughton thoroughly representative.

The Life of the Fly. By J. Henri Fabre. Hodder & Stoughton .. .. 6s. net
The translator, Alexander Teixeira de Mattos, has followed in the most admirable way the simplicity of style which gives the works of the naturalist Fabre such a charm. A delightful rendering of a delightful book.

Billy and Hans. By W. J. Stillman. Bell. 1s. net
A pretty study of two squirrels, one genial and the friend of man, the other morose, but the friend of Billy. When Billy died, Hans grew confidential, and took his place in his master's pocket. A sympathetic and convincing sketch.

The Romance of the Animal World. By E. Selous. 330 pages. Illustrated. Seeley .. .. 5s.
A popular study of the ways of many animals, great and small, written in a very anthropomorphic spirit, but showing much observation and sympathy. Snails, crabs, caterpillars, ants, wasps, birds, snakes, beavers, crocodiles, whales—even the sea-serpent—all have their place.

The Romance of Animal Arts and Crafts. By H. Coupin and John Lea. Illustrated. Seeley.. 5s.
In this book the activities of wild animal life are described as a fairy version of human industry—as the spinning, weaving, sewing, manufacture of paper and pottery, aeronautics, raft-building, road-making, etc., of animals, birds, and insects.

Natural History of Selborne. By Gilbert White.
A charming record of the observation of all kinds of natural happenings in bird-life, plant-life, weather, etc., within a very narrow range, from year to year. The chief use of the book now is its stimulation of the spirit of observation, and its incitement to the keeping of exact records.

The Infancy of Animals. By W. P. Pycraft. 272 pages. Illustrated. Hutchinson .. 6s. net
A scientific treatise, in popular language, of the appearance and habits of the young of a very large number of animals, birds, reptiles, and fishes; of great interest to the student of evolution, the observer of Nature, and for the general reader. The problems of coloration, the ways in which the young are carried, fed, and instructed, their growth and development, and many other interesting facts, are treated of.

Peeps into Nature's Ways. By J. J. Ward. 320 pages. Pitman .. .. 3s. 6d. net
A capital book for students of minute forms of life, including both insects and plants. The illustrations include a large number of micro-photographs taken by the author, one of the chief photographic contributors to the pages of the SELF-EDUCATOR.

The Naturalist in Nicaragua. By Thomas Belt.
The author, one of the greatest of practical observers of last century, travelled over many parts of the world, gold-mining, and at the same time noting the wild life of the regions where he lived. In this book he gives a true and living account of the snakes and birds and strange insects of this part of Central America, where he was stationed for four years. There is no ornate language in his book, but it is vivid and full of colour.

The Horse and Its Relatives. By R. Lydekker. 286 pages. Illustrated. Allen & Unwin. 10s. 6d. net
A popular and yet scientifically accurate account of the natural history of the more important representatives of the horse family. Deals with the wild tarpan, the extinct forerunners of the horse, the wild ass, zebra and quagga, and the model types of horse. Written in an interesting way, and suitable for the general reader.

The Naturalist on the Amazons. By H. W. Bates.
The author of this classical work was a friend of Charles Darwin and of A. R. Wallace, and it was with the latter that the famous expedition to the Amazons was planned and carried out. Both were keen naturalists, and Bates, who remained eleven years on the banks of the Amazons, collected in that time an enormous number of insects, some eight thousand of which were previously unknown to science.

Curiosities of Natural History. By Frank Buckland. Four vols. Macmillan .. .. 2s. 6d. each
Four delightful volumes, the outcome of many years of intimate observation.

The Seashore. By W. S. Furneaux. 454 pages. Illustrated. Longmans .. .. 3s. 6d. net
A very useful book by a writer who is skilful in displaying knowledge in an inviting way. It gives just the kind of guidance needed for those who are starting the study of the wonders of the sea's margin. Abundantly illustrated.

Life by the Seashore. By Marion Newbigin. 344 pages. Illustrated. Allen & Unwin. 2s. 6d. net
This book is written with an attractive simplicity. Its object is to enable those who have had no special zoological training to learn the names and the characters of the common inhabitants of the sea-shore pools.

An Outline of the Natural History of Our Shores. By Joseph Sinel. Illustrated. Allen & Unwin. 7s. 6d.
An addition to the title is "with chapters on collecting and preserving marine specimens, methods of microscopic mounting, and on the marine aquarium." The descriptions, covering a wide field, are chatty and easily understood, and the illustrations are excellent.

Life in the Sea. By J. Johnstone. 150 pages. Illustrated. Cambridge University Press. 1s. net
The investigation of the microscopic life of the sea has reached a point where it is worth while to make broad surveys of the life of the ocean, to consider how the different kinds of organisms affect each other, and how they are influenced by the great seasonal changes that sweep across the sea. Such a discussion of the general economy of the sea is attempted in this book.

Fresh-water Aquaria. By G. C. Bateman. 350 pages. Illustrated. Upcott Gill .. .. .. 3s. 6d.
A profusely illustrated handbook, dealing with the construction, arrangement, and management of aquaria, with descriptions of suitable water-plants and live-stock, and how to obtain them.

British Mammals. By Sir Harry Johnston. 405 pages. Illustrated. Hutchinson .. 12s. 6d. net
This handsome volume, most beautifully illustrated with coloured plates and with drawings and photographs, forms one of the series of natural history volumes of the Woburn Library, edited by the Duke of Bedford. It includes an account of the mammals of Britain from pleistocene ages to the present day.

The Mammalia in Their Relation to Primeval Times. By Oscar Schmidt. Illustrated. Kegan Paul. 5s.
A study of the mammalia in their relation to palæontology and anthropology. After discussing the distinctive characteristics of the mammals and their position in the animal kingdom, Professor Schmidt divides them, in a comparison of the living animals with their ancestors, into forked animals, marsupials, animals poor in teeth, hoofed animals, pair-hoofed animals, odd-hoofed animals; and then follows miscellaneous lines up to man, and the man that is to be.

An Introduction to the Study of Mammals. By W. H. Flower and R. Lydekker. Black. 12s. 6d.
A comprehensive book for students, covering mammals living and extinct, and entering into considerable detail in a number of selected members of the order. It contains a copious bibliography.

A Book of Whales. By F. E. Beddard. 320 pages. Illustrated. John Murray .. .. 6s. net
A comprehensive account of the cetacea, giving the main facts of their structure and mode of life, and especially dwelling on the intimate relation between structure and environment—a biological generalisation that is shown in the whales in a striking degree.

The Horse : a Study in Natural History. By W. H. Flower. Illustrated. Kegan Paul .. 2s. 6d.
Discusses the place of the horse in Nature, and its ancestors and relatives. Examines the structure of the horse in its bearing upon its manner of life, its evolution, and relation to other animal forms. A good example of a work popular yet scientific.

The Ox and Its Kindred. By R. Lydekker. 271 pages. Illustrated. Methuen .. .. 6s.
Gives the history of the extermination of the great wild ox of Europe and Asia. Deals with the so-called white wild cattle of British parks, and the humped cattle of Asia and Africa ; but the main theme is the domesticated breeds of ancient and modern times. Sound and clear.

The World's Birds. By F. Finn. 180 pages. Illustrated. Hutchinson .. .. .. 5s. net
A practical and comprehensive classification of living birds, the description of each family being fully elaborated under the headings—diagnosis ; size ; form, plumage, and coloration ; young ; nest ; eggs ; incubation ; food ; gait ; flight ; note ; disposition and habits ; economic qualities ; captivity ; distribution and species.

A History of Birds. By W. P. Pycraft. 458 pages. Illustrated. Methuen .. .. 10s. 6d. net
An excellent work, written from the point of view of the evolutionist, surveying the evidence bearing on the birth and growth of various types of birds, and presenting the study of a bird as one of the living organisms moulded in part by an inherent constitution, and in part by the struggle with environment.

A Handbook of British Birds. By J. E. Harting. 551 pages. Illustrated. Routledge .. £2 2s.
Shows the distribution of the resident and migratory species of birds in the British islands, and gives a record of the rarer visitants. Contains in a single volume, enriched with 35 coloured plates, the precise status of every British bird, and, according to the author, conveys information of a kind not to be found in any other work on British birds.

British Birds. By W. H. Hudson. Illustrated. Longmans .. .. 3s. 6d. net
The best cheap English book on British birds, written by a master of pure English, and a most competent and sympathetic observer.

British Birds in Their Haunts. By C. A. Johns. Routledge .. .. 7s. 6d. net
An admirable work brought up to date, and embellished with 64 coloured plates. Contains a glossary of common and provincial names and technical terms. Many delightful stories and descriptions of the daily life of birds.

The Romance of Bird Life. By John Lea. 376 pages. Illustrated. Seeley .. .. .. 5s.
A popular study of the courtship, fighting, education, sports, toilet, migration of birds, and even their wisdom and follies.

British Birds and Their Eggs. By J. M. Boraston. Coloured illustrations. Chambers .. .. 6s. net
This book, containing a new method of identification, is written for the beginner, so that he may recognise any bird from its most obvious characteristics, such as broad distinctions of colour, markings, gestures, and song.

Britain's Birds and Their Nests. By A. L. Thomson. Coloured illustrations. Chambers .. 21s. net
A delightful book, dealing with all the birds of our country in their respective orders and families. The coloured drawings have been made by Mr. George Rankin from close observation of the birds and their eggs and nests.

Eggs and Nests of British Birds. By F. Finn. 231 pages. Illustrated. Hutchinson .. 5s. net
An excellent and comprehensive manual of pocket size, including coloured reproductions of 154 eggs from nature, in 20 plates, reproductions of 74 eggs in half-tone, and other illustrations. Useful for the collector, and very reliable.

Birds of the Countryside. By F. Finn. 186 pages. Illustrated. Hutchinson.. .. .. 5s. net
With 12 coloured plates, 118 photographs, and many outline drawings, this little pocket manual is useful to anyone who wishes to be able to identify British birds.

The Migration of Birds. By T. A. Coward. 130 pages. Maps. Cambridge University Press. 1s. net
A fascinating subject is treated in this book in a common-sense manner by a modest author. In commenting on routes used in migration, several maps are given. Much attention is paid to the effects of wind and weather on bird flights.

Reptiles of the World. By Raymond L. Ditmars. 391 pages. Illustrated. Pitman .. 20s. net
The photographs, by the curator of reptiles in the New York Zoological Park, give this book unique value. The work is at once popular and scientific, and includes tortoises, turtles, crocodiles, lizards, and snakes as observed in many parts of the world.

Reptile Life. By W. P. Pycraft. 208 pages. Illustrated. Hodder & Stoughton .. .. 1s. net
The author begins by distinguishing between a true reptile and such "amphibia" as frogs, toads, etc. The form and habits of some of the most interesting reptiles, such as lizards, tortoises, crocodiles, geckos, chameleons, snakes, are described in detail.

British Serpents. By Gerald Leighton. 383 pages. Illustrated. Blackwood .. .. .. 5s. net
A book of great value. The only volume entirely devoted to the life history and local distribution of the native British serpent. Largely illustrated from photographs.

British Lizards. By Gerald Leighton. 214 pages. Illustrated. Upcott Gill .. .. .. 5s.
The author is an eminent authority on his subject, and this book, dealing with lizards in every county, is the only volume devoted solely to the life history and local distribution of British lizards.

An Introduction to the Study of Fishes. By A. C. L. G. Gunther. 736 pages. Illus. Black .. 12s. 6d.
Gives in a concise form an account of the principal facts relating to the structure, classification, and life history of fishes. A useful book of reference.

Origin and Metamorphoses of Insects. By Lord Avebury. Illustrated. Macmillan .. 3s. 6d.
An introduction to the life history of insects, by the well-known naturalist, banker, and statesman, written with all the charm which he always found in Nature-study. Many clear line-drawings illustrate the text.

Natural History of British Fishes. By Frank Buckland. Illustrated. S.P.C.K... .. 3s. 6d. net
A book for the general reader, giving an account of the structure and economic uses of British fishes, and their capture by net and rod, with many useful hints both to sea and fresh-water fishermen. Methods of fish-culture in ponds and hatcheries are described.

British Fresh-Water Fishes. By Sir Herbert Maxwell. 316 pages. Illustrated. Hutchinson. 5s. net
Another of the handsome series edited by the Duke of Bedford. The British species, which number only about fifty out of a vast variety now known to science, are described, for sake of accuracy, in scientific terminology, and afterwards with all the interesting details gathered by an expert observer. The descriptions are full of interest, and the coloured plates beautiful.

British Salt-Water Fishes. By F. G. Aflalo. 328 pages. Illustrated. Hutchinson .. 12s. 6d. net
Another of the handsome natural history books edited by the Duke of Bedford, and illustrated with very fine coloured plates. The author gives a scientific account of the salt-water fishes which can be described as British, summarising their habits and appearance, their distribution, and their migrations. As is here pointed out, the study of life in the seas has a practical bearing on British industrial supremacy.

The Fresh-Water Fishes of the British Isles. By C. T. Regan. 312 pages. Illus. Methuen 6s.
A popular account of the fishes of our lakes and rivers, their characters, geographical distribution, and life history. The most recent researches, such as those on the growth and migrations of the salmon, and on the life and history of the eel, are explained in a lucid and arresting manner.

Insects : Their Structure and Life. A Primer of Entomology. By G. H. Carpenter. Dent 4s. 6d. net
A small, cheap book, sketching in outline the whole subject of the study of insect life. Gives the life history of insects. Traces their relationship, the origin of wings, and metamorphosis.

Insect Life: Souvenirs of a Naturalist. By J. H. Fabre. 320 pages. Illus. Macmillan .. .. 2s. 6d.
One of the classics of modern science, by a master naturalist with a fine talent for literature. Introduces the reader into the strange, weird, wonderful world of insect life, some of the secrets of which it has taken Dr. Fabre a long life of constant, intense observation to discover. Unequalled for studies of living insects whose instincts are best developed.

The Life and Love of the Insect. By J. H. Fabre. 262 pages. Black .. .. 5s.
The author was all his life a keen and minute observer of the habits and manners of insects, and was, without doubt, the greatest entomologist of our times. This smaller work, which is a selection from his famous "Souvenirs Entomologique," is at once eminently scientific and extremely fascinating.

Insect Wonderland. By Constance M. Foot. 196 pages. Illustrated. Methuen .. 3s. 6d. net
A volume of simple facts concerning the insect world, dealing with representatives of the seven great orders of insects. Suitable for reading by children, for pleasure and information.

House-Flies. By C. G. Hewitt. 122 pages. Illustrated. Cambridge University Press .. 1s. net
A well-written and illustrated handbook on the structure and habits of the house-fly, and especially on the part it plays in the spreading of disease.

Insect Life. By F. V. Theobald. 235 pages. Illustrated. Methuen .. .. 2s. 6d.
A cheap, sound, and concise account of the classification and habits of insects. Deals with their metamorphosis and structure, and then describes in a broad, brief way the characters of the various orders. Has an appendix on insecticides.

The Romance of Insect Life. By Edmund Selous. 350 pages. Illustrated. Seeley .. .. 5s.
Interesting descriptions of the strange and curious in the insect world, including many kinds of ants and their remarkably ingenious customs, caterpillars, spiders, aquatic insects, scorpions, etc.

A Textbook of Entomology. By Alpheus S. Packard. 729 pages. Illustrated. Macmillan. 19s. net
A comprehensive work by an American author, designed for the use both of students and teachers. "The aim has been to afford a broad foundation for more special work by anyone who may want to study some group of insects." The chapters' headings are: Morphology and Physiology, Internal Anatomy, Embryology, and Metamorphosis.

British Insects. By E. F. Staveley. 407 pages. Illustrated in colours. Lovell Reeve. 7s. 6d. net
A practical book for the use of observers of insects, describing the form, structure, habits, and changes of the principal British examples. Excellently illustrated by coloured plates.

Our Insect Friends and Foes. By F. Martin Duncan. 296 pages. Illustrated. Methuen .. .. 6s.
This highly interesting book not only describes numerous forms and habits of insect life, but also points out vividly their bearing upon human health and prosperity. Chapters deal with insect communities; aquatic insects; insect actors; insects in commerce; poison-fang and stiletto; insects and flowers; our beetle friends; our insect foes—ravagers of crops and transmitters of disease. The plates are very good.

The British Lepidoptera. By Richard South. Three vols. Illustrated. Warne .. .. 21s. net
The illustrations are the most beautiful and realistic pictures of moths that could possibly be produced. Some of them, cut out and mounted in a glass case, are practically indistinguishable from actual specimens. Of immense value to practical entomologists. The volumes are also sold separately: The Butterflies of the British Isles, 6s. net; The Moths of the British Isles, 6s. net each.

Butterflies and Moths of the Countryside. By F. E. Hulme. 300 pages. Illus. Hutchinson. 8s. 6d.
This large and handsome volume has thirty-five coloured plates by the author, showing many different species. The text describes the appearance, life-history, and localities of British moths and butterflies.

British Dragonflies. By W. J. Lucas. 350 pages. Illustrated. Upcott Gill .. .. 10s. 6d.
A beautiful book on the life-history, species, and varieties of our dragonflies, with remarks on their capture and preservation. An exhaustive treatise, adorned with 27 carefully printed plates in colour, with engravings in the text.

The Dispersal of Shells. By Harry Wallis Kew. 291 pages. Illustrated. Kegan Paul .. .. 5s.
Dr. Alfred Russel Wallace, in a preface to this book, says that many books of far greater pretension, even though they contain descriptions of scores of new species of shells, may be of less interest than this general summary of dispersal. The writer has gathered his facts with great industry, and writes a first book with modesty.

The Lore of the Honey-Bee. By Tickner Edwardes. 196 pages. Methuen .. .. .. 1s. net
An instructive and entertaining little book on the life of the bee community, with a gleaning of old beliefs and stories concerning bees, and an account of some bee-farms of today.

The Life of the Bee. By Maurice Maeterlinck. 344 pages. Allen & Unwin .. .. 2s. 6d. net
A sympathetic and imaginative study of bee life and work, including many profound if somewhat hazy meditations on nature, instinct, destiny, etc. The book has great literary value.

The Honey-Bee. By T. W. Cowan. 220 pages. Illustrated. Houlston .. .. .. 2s. 6d.
This admirable manual on the natural history, anatomy, and physiology of the bee is by the editor of the "British Bee Journal." The book is purely scientific, not a guide to bee-keeping.

Shell Life. By Edward Step. Illus. Warne. 6s.
An introduction to the British mollusca, with 32 plates photographed from the actual shells, and upwards of 300 figures in the text. A useful volume for all who wish to know something of the common objects of the seashore. The information is arranged on a scientific basis, not too technical.

Earthworms and Their Allies. By F. E. Beddard. 143 pages. Cambridge University Press. 1s. net
Mr. Beddard introduces first the anatomical structure of the worm, describes its mode of life, discusses the relative frequency of earthworms in different regions of the world, and traces their movements and migrations. His survey includes nearly all the usually admitted genera. The literature of the subject is included under geographical divisions.

The Life of Crustacea. By W. T. Calman. 305 pages. Illustrated. Methuen .. .. 6s.
Gives an account of the wonderfully diversified habits and modes of life of the large division of the animal kingdom that includes lobsters. Addressed to the general reader, in non-technical language.

The Crayfish. By T. H. Huxley. 371 pages. Illustrated. Kegan Paul .. .. 5s.
In this careful study of one of the commonest and most insignificant of animals, Professor Huxley takes the reader from matters of everyday knowledge to the widest views and most difficult problems in the study of life. It is an admirable introduction to zoology.

Jelly-Fish, Starfish, and Sea-Urchins: Being a Research on Primitive Nervous Systems. By G. J. Romanes. 323 pages. Kegan Paul .. 5s.
A book that made the author famous. He shows that the nervous tissue first appears on the scene of life with the qualities it displays in the higher animals. Proved the sense of smell in starfish, by keeping some of these animals without food and then putting small pieces of food near them.

The Foraminifera. By Frederick Chapman. 354 pages. Illustrated. Longmans .. 9s. net
A concise account of the foraminifera, suited to the requirements of the student of natural history and palæontology, and bringing knowledge of the life-history of this and other groups of protozoa and their geographical distribution up to date.

The Protozoa. By Gary N. Calkins. 363 pages. Illustrated. Macmillan .. .. 12s. 6d. net
A summary of the most recent discoveries concerning the minute lower animals. Has an historical sketch of this branch of microscopic science; deals with the organs and functions and structure of the minute animals found in the dust of the air, in the sea, in ditches, in fresh waters and drinking waters, and in the bodies of the higher plants and animals.

British Spiders. By E. F. Staveley. 295 pages. Illustrated in colours. Lovell Reeve. 7s. 6d. net
A well-illustrated book, enabling the reader to identify the different examples of the spider tribe found in Great Britain and Ireland, and to begin their study under competent guidance.

Spiders. By C. Warburton. 136 pages. Illustrated. Cambridge University Press .. 1s. net
This book is concerned with the habits and modes of life of the spiders which are most frequently met with and most easily recognised, and considerable stress is laid on the methods of research by which our modern knowledge of spiders has been obtained. The book is written with clearness and energy.

Animal Parasites and Messmates. By P. J. van Beneden. 274 pages. Illus. Kegan Paul. 5s.
A book of the romances of the minute. The author, a professor at Louvain, who believes boldly in God-given instinct, treats animals first as messmates, then as "mutualists," and last as parasites. The parasites are either free during their own life, or while young, or when old, or they undergo metamorphoses, or they are parasites all their life long. In any case, they are interesting companions as introduced by Professor Beneden.

Plant-Animals. By F. Keeble. 163 pages. Illustrated. Cambridge University Press. .. 1s. net
The plant-animals here discussed are two marine worms. Their nature and behaviour, as observed on the coast of Brittany, are discussed with minuteness after exhaustive observation.

Anecdotes of Dogs. By E. Jesse. Woodcuts and Engravings. Bell .. .. 5s.
A quaint, old-fashioned book of the middle of the nineteenth century, with many illustrations of faithful dogs—some by Bewick.

The Snakes of Europe. By G. A. Boulenger. Methuen .. .. 5s.
This is a strictly scientific book, giving in a concise form an account of the snakes of Europe, their characters, distribution, and life-histories, preceded by an introduction summarising what is known of snakes generally. The author claims that there is no similar work in English.

BACTERIOLOGY

Bacteria and Their Products. By G. S. Woodhead. 459 pages. Illustrated. Walter Scott 3s. 6d.
An account of the main facts in bacteriology and the life history of bacteria and closely allied organisms, with a discussion of the most important theories as to the part that they play in Nature's economy, especially in their relation to the various fermentative, putrefactive, and disease processes.

The Bacteriology of Milk. By Harold Swithinbank and Sir George Newman. John Murray. 25s. net
Sir George Newman is Chief Medical Officer of the Board of Education, and has special chapters on the spread of disease by milk and the control of the milk supply. There is no better textbook for students of the science of public health, and this book should be part of the stock-in-trade of dairyman and medical officer. A work of national value.

Tropical Diseases. By Sir Patrick Manson. 896 pages. Illustrated. Cassell .. .. 12s. 6d.
A manual of the diseases of warm climates, by the discoverer of the fact that some of the most dreadful maladies of tropical countries are communicated by mosquitoes and other insects. Intended principally for travellers and settlers, but forms a handy survey of the whole field of tropical diseases. Shows how the white races are at last obtaining control of the tropics. A chapter in the story of civilisation.

Bacteriology and the Public Health. By Sir George Newman. 497 pp. Illus. John Murray. 21s. net. Dr. Newman, the Chief Medical Officer of the Board of Education, here writes with the object of supplying what is necessary for the student of hygiene and the officer of health to know concerning everyday problems of sanitation and preventive medicine. A most valuable book.

Bacteria in Relation to Country Life. By J. G. Lipman. 486 pages. Illus. Macmillan. 6s. 6d. A discussion of the character of bacteria in rural conditions, with a view to solving many practical problems on the farm. Technical terms and expressions are omitted as far as practicable. Deals with purity of water-supply; bacteria and sewage, and soil fertility; and with bacteria in milk.

Our Secret Friends and Foes. By Percy Faraday Frankland. Illustrated. S.P.C.K. .. 3s. A popular description, by the Professor of Chemistry in the University of Birmingham, of bacteria, and of recent progress in the science of bacteriology. As the title suggests, the book deals with bacteria in relation to human life.

Germ Life : Bacteria. By H. W. Conn. 212 pages. Illustrated. Hodder and Stoughton .. 1s. net. Recognising that bacteria are generally regarded only as agents of disease, the author has here given a wider and more balanced view of the subject. He shows that these organisms "are to be regarded not primarily in the light of enemies, but as friends." The subject is ably treated in popular language.

Household Bacteriology. By E. D. and R. E. Buchanan. 536 pages. Illus. Macmillan. 10s. Intended primarily for students in domestic science. Points out the relation between a knowledge of bacteria and the preparation and preservation of food, household sanitation, and personal hygiene. The book is really an elementary but broad survey of the science of microbe activities, with the various affairs of the household as pegs on which to hang the discussion.

Bacteria, Yeasts, and Moulds in the Home. By H. W. Conn. 293 pages. Illustrated. Ginn. 4s. 6d. An exceedingly interesting and useful little book, providing a scientific basis for home economy. It treats of moulds and the decay of fruit; of yeasts and their uses in fermentation of bread and of liquors; of bacteria and the preservation of food by various methods; of disease bacteria and safeguards against contagion; and of many important subjects of kindred interest.

Outlines of Bacteriology. By David Ellis. 262 pages. Illustrated. Longmans .. 7s. 6d. net. This book is written more particularly for the use of students of technical and agricultural bacteriology; but it will also serve as an introduction to all branches of the subject. The aim has been to demonstrate the fundamental principles underlying the technical application of bacteriology, but matters of theoretical interest have also been introduced, because the science is in a stage when theoretical extension and investigation are highly important. A remarkably comprehensive work.

Bacteria as Friends and Foes of the Dairy Farmer. By W. Sadler. 112 pages. Illus. Methuen. 1s. 6d. A clearly written, practical work on useful and dangerous microbes connected with the dairy industries. Discusses "starters" in cheesemaking and butter-making; troubles in milk production; disease germs and milk, and the necessity for disinfecting dairies and utensils. Shows how to establish a standard quality by the scientific control of the acid germs.

Manual of Bacteriology. By A. B. Griffiths. 348 pages. Illustrated. Heinemann .. .. 5s. A good popular introduction to the study of bacteria, giving special attention to laboratory methods, infectious diseases, and microbes of the air, of the soil, and of the water.

Manual of Bacteriology. By Robert Muir and James Ritchie. 605 pages. Illustrated. Oxford Medical Publications.. .. .. .. 10s. 6d. net. A most valuable book, comprising a systematic description of the various kinds of bacteria, and a consideration of the evidence of their relation to various diseases. There is a splendid bibliography.

The Prevention of Malaria. By Sir Ronald Ross. Illustrated. John Murray .. .. 21s. net. Major Ross and his colleagues in the medical school of tropical medicine have here given the world a book splendidly worthy of their high reputation. There are contributions by twenty notable experts in malarial fever, and the book is perhaps the most complete exposition of the subject in English.

Mosquito or Man? By Sir Rubert W. Boyce. Illustrated. John Murray .. 10s. 6d. net. A wonderful record of the progress of the campaign against the parasite. A story of the conquests of the tropical world for civilisation, bringing home to the reader the scientific and economic importance of the battle between man and the mosquito. Photographs illustrate several of the insects concerned in the propagation of disease, and there are practical illustrations showing steps in the campaign which has opened up a new world to the white races.

Yellow Fever and Its Prevention. By Sir Rubert W. Boyce. Illustrated. John Murray. 10s. 6d. net. This practical manual is a summary of the author's experiences and investigations on yellow fever in New Orleans, Central and South America, the West Indies, and West Africa. The subject is treated historically, geographically, and clinically. It also contains chapters on treatment, pathology, diagnosis, and epidemiology.

ELECTRICITY

Embracing Telegraphs and Telephones, and including Wireless.

The Autobiography of an Electron. By Charles R. Gibson. 216 pages. Illustrated. Seeley. 3s. 6d. Believing that if the story of modern science were told in a very popular form it would interest a large public, the writer lets one of the smallest invisible particles of matter tell the tale of its existence. So simply written that intelligent children can become acquainted with the advances in physical science.

Elements and Electrons. By Sir William Ramsay. 172 pages. Harper .. .. .. 2s. 6d. net A brief first-hand account of the new theory of the transformation of matter, by the boldest and most successful of experimenters. Describes the modern advances in the study of matter, and discusses the evolution of the atom, and the changing of one element into another.

The Electron Theory. By E. E. Fournier d'Albe. 327 pages. Illustrations. Longmans .. 5s. net. A popular introduction to the new theory of electricity and magnetism, largely based on Johnstone Stoney's views. A suggestive and stimulating speculation in regard to the ultimate problems of matter and force, by a writer with original ideas.

The Telephone, the Microphone, and the Phonograph. By Count du Moncel. Kegan Paul .. 5s. net. A useful general sketch of the history of the "'phone" systems, with the various improvements successively introduced. Amply illustrated.

Electrons ; or, the Nature and Properties of Negative Electricity. By Sir Oliver Lodge. Bell .. 6s.
A discourse on recent progress towards knowledge of the nature of electricity, especially as concerns atomic structure. The greater part is written in the plain, energetic English characteristic of the author, but a few mathematical equations are introduced.

Electricity and Magnetism. By James Clerk-Maxwell. Two vols. Clarendon Press .. .. 32s.
One of the great books of science. It was in this book that Clerk-Maxwell constructed his famous theory of electricity, in which action at a distance should be replaced by action through a medium ; and in it he enunciates the principles of an electromagnetic theory of light which has formed the basis of much modern progress.

Magnetism. By E. J. Houston. 525 pages. Illustrated. Chambers .. .. 2s. 6d.
In a popular way Dr. Houston tells of magnetic batteries and currents ; lodestones ; magnets that remember and magnets that forget ; the compass and its variations ; peculiarities of the earth's magnetism ; and the Northern Lights. A book of common marvels attractively displayed.

Modern Views of Electricity. By Sir Oliver Lodge. 534 pages. Illustrated. Macmillan .. .. 6s.
This volume expounds the ethereal doctrine of electricity. "Crudely, one may say that as heat is a form of energy, or a mode of motion, so electricity is a form of ether or a mode of ethereal manifestation." This doctrine is developed by gradual stages, under the main headings : Electrostatics ; conduction ; magnetism ; radiation. A clear and scientific exposition.

Electric Waves. By Heinrich Hertz. With a preface by Lord Kelvin. Macmillan .. 10s. net
A first-hand account of the researches on the propagation of electric action through space, that led to the discovery of wireless telegraphy and telephony. Hertz describes how he was first led to carry out his experiments, and relates how his endeavours, long fruitless, were at last brought to a successful conclusion. The first part of the book is fairly easy ; the latter part is rather abstruse.

Elementary Lessons in Electricity and Magnetism. By Silvanus P. Thompson. Macmillan .. 4s. 6d.
Deals with the progress of research up to Hertz's discovery of electric waves, and his confirmation of Clerk-Maxwell's theories. Presents with clearness and brevity an elementary exposition of the leading phenomena and their relations to one another. Has a valuable chapter on dynamos and transformers, on which the author writes with authority.

The Romance of Modern Electricity. By Charles R. Gibson. 345 pages. Illustrated. Seeley .. 5s.
Describes in simple language, suited to young readers, the story of electricity ; how it came to be known ; its relation to magnetism ; the various ways in which it is used, and its great value to life in so many different channels.

Electricity. By Gisbert Kapp. 253 pages. Williams & Norgate .. .. 1s.
The author here describes the force and action of electricity, the methods of electrification, and the distribution of electricity under the many aspects in which our knowledge and use of the force today present themselves.

Experimental Researches in Electricity. By Michael Faraday. Dent .. .. 1s.
This volume includes Faraday's most famous lectures on electricity, as well as a sympathetic account of the man by Professor Tyndall.

GENERAL BOOKS ON ELECTRICITY

Mathematical and Physical Papers. By Lord Kelvin. 6 vols. (Camb. Univ. Press.) 97s. net.
Scientific Papers of Lord Rayleigh. 5 vols. (Camb. Univ. Press.) 75s. net.
Reports of the Committee on Electrical Standards. (Camb. Univ. Press.) 12s. 6d. net.
Electrical Researches of Henry Cavendish. Edited by J. Clerk-Maxwell. (Camb. Univ. Press.) 18s.
Examples in Applied Electricity. By C. G. Lamb. (Camb. Univ. Press.) 2s. 6d. net.
Electricity and Magnetism. By R. T. Glazebrook. (Camb. Univ. Press.) 6s.
Elements of Electrical Engineering. By Prof. W. S. Franklin and Prof. W. Esty. 2 vols. (Macmillan.) 34s. net.
Electrical Engineering in Theory and Practice. By G. D. A. Parr. (Macmillan.) 12s. net.
Studies in Terrestrial Magnetism. By Dr. C. Chree. (Macmillan.) 5s. net.
Elementary Treatise on Electricity and Magnetism. By G. C. Foster and A. W. Porter. (Longmans.) 10s. 6d. net.
Examples in Electrical Engineering. By Samuel Joyce. (Longmans.) 5s.
Electrotechnics. By Dr. John Henderson. (Longmans.) 3s. 6d.
History of the Theories of Æther and Electricity. By A. E. Whittaker. (Longmans.) 12s. 6d. net.
Textbook of Electrical Engineering. By Dr. Adolf Thomälen. (Arnold.) 15s. net.
Elementary Treatise on Electricity. By J. Clerk-Maxwell. (Clarendon Press.) 7s. 6d.
Pocket-book of Electrical Rules and Tables. By John Munro and Prof. Jamieson. (Griffin.) 8s. 6d.
Management of Electrical Machinery. By Dr. F. B. Crocker. (Spon.) 4s. 6d. net.
Practical Engineer's Handbook on the Care and Management of Electric Power Plants. By Norman H. Schreider. (Spon.) 5s. net.
Diseases of Electrical Machinery. By Sylvanus Thompson. (Spon.) 2s. net.
Electrical Tables and Memoranda for the Waistcoat Pocket. By Sylvanus Thompson. (Spon.) 1s.
Practical Electrical Engineering for Elementary Students. By W. S. Ibbetson. (Spon.) 3s. 6d.
Electricity Simplified. By Dr. T. O'Conor Sloane. (Spon.) 4s. 6d. net.
Magnetic Induction in Iron and other Metals. By Sir J. A. Ewing. ("Electrician.") 10s. 6d.
The Electromagnet and Electromagnetic Mechanism. By S. P. Thompson. (Spon.) 15s.
Elementary Lessons in Electricity and Magnetism. By S. P. Thompson. (Macmillan.) 4s. 6d.
Experimental Researches in Electricity. By Michael Faraday. 3 vols. (Quaritch.) 48s.

THEORY

Mathematical Theory of Electricity and Magnetism. By J. H. Jeans. (Camb. Univ. Press.) 15s. net.
Electric Waves. By H. M. Macdonald. (Camb. Univ. Press.) 10s.
Radio-active Substances and their Radiations. By Sir Ernest Rutherford. (Camb. Univ. Press.) 15s. net.
Electromagnetic Radiation. By Dr. G. A. Schott. (Camb. Univ. Press.) 18s. net.
Elements of the Mathematical Theory of Electricity and Magnetism. By Sir J. J. Thomson. (Camb. Univ. Press.) 10s.
Outlines of the Theory of Electromagnetism. By Gilbert T. Walker. (Camb. Univ. Press.) 3s.

Modern Electrical Theory. By N. R. Campbell. (Camb. Univ. Press.) 9s. net.
Elements of Electromagnetic Theory. By S J. Barnett. (Macmillan.) 12s. 6d. net.
Electric Waves. By Prof. W. S. Franklin. (Macmillan.) 12s. net.
Electromagnetic Theory of Light. By C. E. Curry. (Macmillan.) 12s. 6d. net.
Introduction to the Mathematical Theory of Electricity and Magnetism. By W. T. A. Emtage. (Clarendon Press.) 7s. 6d.
Mathematical Theory of Electricity and Magnetism. By H. W. Watson and S. H. Burbury. 2 vols. (Clarendon Press.) 12s.
Treatise on Electricity and Magnetism. By Clerk-Maxwell. 2 vols. (Clarendon Press.) 32s.
Recent Researches in Electricity and Magnetism. By Sir J. J. Thomson. (Clarendon Press.) 18s. 6d.
Theoretical Elements of Electrical Engineering. By C. P. Steinmetz. (Hill Publishing Co.) 17s. net.
Electronic Theory of Electricity. By J. A. Fleming. ("Electrician.") 1s. 6d.

LABORATORY WORK

Photo-Electricity. By Dr. A. L. Hughes. (Camb. Univ. Press.) 6s. net.
Conduction of Electricity through Gases. By Sir J. J. Thomson. (Camb. Univ. Press.) 16s.
Theory and Practice of Absolute Measurements in Electricity and Magnetism. By Andrew Grey. 2 vols. (Macmillan.) 37s. 6d.
Laboratory Manual of Alternating Currents. By John H. Morecroft. (Longmans.) 7s. 6d. net.
Photo-Electricity, the Liberation of Electrons by Light. By Dr. H. Stanley Allen. (Longmans.) 7s. 6d. net.
Mathematical Analysis of Electrical and Optical Wave Motion. By Dr. H. Bateman. (Cambridge Univ. Press.) 7s. 6d. net.
Measurement of Electrical Resistance. By W. A. Price. (Clarendon Press.) 6s.
Handbook of Electrical Testing. By H. R. Kempe. (Spon.) 18s. net.
Electrical Laboratory Notes and Forms. By B. A. Fleming. ("Electrician.") 15s. net.
Industrial Photometry. By A. Palaz. (Sampson Low.) 12s. 6d.

ACCUMULATORS, BATTERIES, AND CELLS

Storage Batteries. By H. W. Morse. (Macmillan.) 6s. 6d. net.
Primary Batteries: their Construction and Use. By W. R. Cooper. ("Electrician.") 10s. 6d.
Secondary Batteries: their Manufacture and Use. By E. F. Wade. ("Electrician.") 10s. 6d.
Management of Accumulators. By Sir D. Salomons. (Whittaker.) 6s. net.

CURRENTS

Treatise on the Theory of Alternating Currents. By Alexander Russell 2 vols. (Camb. Univ. Press.) 27s. net.
Vectors and Vector Diagrams Applied to the Alternating Current Circuit. By W. Cramp and C. F. Smith. (Longmans.) 7s. 6d. net.
Electric and Magnetic Circuits. By E. H. Crapper. (Arnold.) 10s. 6d. net.
Foundations of the Alternate Current Theory. By Dr. C. V. Drysdale. (Arnold.) 8s. 6d. net.
Alternating Currents. By C. G. Lamb. (Arnold.) 10s. 6d. net.
Alternating Currents of Electricity. By A. Still. (Whittaker.) 5s.
Polyphase Electric Currents. By S. P. Thompson. (Spon.) 21s.
Polyphase Currents. By A. Still. (Whittaker.) 6s.

DYNAMOS AND MOTORS

Insulation and Design of Electric Windings. By A. Fleming and R. Johnson. (Longmans.) 7s. 6d.
Dynamo Electric Machinery. By Silvanus P. Thompson. 2 vols. (Spon.) 60s. net.
Continuous Current Dynamo Design. By H. M. Hobart. (Whittaker.) 7s. 6d.
Dynamo and Motor Attendants and their Machines. By F. Broadbent. (Rentell.) 1s. 6d
The Dynamo. By C. C. Hawkins and F. Wallis. (Whittaker.) 2 vols. 10s. 6d. net each.
Electric Machine Design. By F. H. Parshall and H. M. Hobart. ("Engineering.") 42s.
Original Papers on Dynamo Machinery. By J. Hopkinson. (Hill Pub. Co.) 4s. 6d. net.

ELECTROCHEMISTRY AND METALLURGY

Electric Furnaces. By Wilhelm Borchers. Translated by H. G. Solomon (Longmans.) 7s. 6d.
Rays of Positive Electricity and their Application to Chemical Analysis. By Sir J. J. Thomson. (Longmans.) 5s. net.
Principles of Applied Electrochemistry. By Dr. A. J. Allmand. (Arnold.) 18s. net.
Electrolytic Preparations. By Carl Elbs. Translated by R. S. Hutton. (Arnold.) 4s. 6d. net.
Electric Smelting and Refining. By Dr. W. Borchers and W. G. McMillan. (Griffin.) 21s.
Treatise on Electro-Metallurgy. By W. G. McMillan and M. R. Cooper. (Griffin.) 12s. 6d.
Electric Furnace. By H. Moissan. (Arnold.) 10s. 6d.

ELECTROPLATING AND ELECTROTYPING

Practical Electroplating By W. R. Barclay and C. H. Hainsworth. (Arnold.) 7s. 6d. net.
Electro-Metallurgy Practically Treated. By A. Watt. (Lockwood.) 4s.

HEATING, LIGHTING, AND BELLS

Principles and Practice of Electric Wiring. By A. Bursill. (Longmans.) 3s. net.
Practical Electric Wiring. By C. C. Metcalfe. (Harper.) 5s. net
Electrical Photometry and Illumination. By Hermann Bohle. (Griffin.) 10s. 6d. net.
How to Instal Electric Bells. By Norman H. Schneider. (Spon.) 1s 6d. net.
Electric Lighting. By Dr. F. B. Crocker. 2 vols. (Spon.) 25s. net.
Theory and Practice of Electric Wiring. By W. S. Ibbetson. (Spon.) 3s. 6d. net.
House Wiring. By T. W. Poppe. (Spon.) 2s. 6d.
Art of Illumination. By Dr. Louis Bell. (Constable.) 10s. 6d. net.
Electric Lamps and Electric Lighting. By Dr. J. A. Fleming. ("Electrician.") 6s.
The Electric Arc. By Mrs. Ayrton. ("Electrician.") 12s. 6d.
Electric Lighting. By A. A. C. Swinton. (Lockwood.) 1s. 6d.
Electric Wiring Tables By W. P. Maycock. (Whittaker.) 3s. 6d.
Electric Wiring. By W. C. Clinton. (John Murray.) 2s.
Practical Electric Light Fitting. By F. C. Allsop. (Whittaker.) 4s. 6d. net.
Electric Bell Construction. By F. C. Allsop. (Spon.) 2s. 6d.
Internal Wiring of Buildings. By H. M. Leaf. (Constable.) 3s. 6d. net.
Electric Wiring, Fittings, Switches, and Lamps. By W. P. Maycock. (Whittaker.) 6s. net.
Electric Wiremen's Work. By J. H. Havelock. (Lockwood.) 5s. net.
Electrical Engineers' Pocket-book. By H. A. Foster. (Constable.) 21s. net.

SUPPLY AND POWER STATIONS

Elements of Electrical Transmission. By O. J Ferguson. (Macmillan.) 15s. net.
Power-house Design. By John F. C. Snell. (Longmans.) 21s. net.
Central Electrical Stations By C H. Wordingham. (Griffin.) 24s. net.
Electricity Meters. By H. G. Solomon. (Griffin.) 16s
Electrical Transmission of Energy. By A. V. Abbot. (Sampson, Low.) 25s. net.
Switchboard Measuring Instruments. By J. C. Connan. (Spon.) 5s. net.
Electric Power Transmission. By Dr. Louis Bell. (Constable.) 16s. net.
Central Station Electricity Supply. By A. Gay and C. H. Yeaman. (Whittaker.) 10s. 6d.
Electric Transmission of Energy. By G. Kapp. (Whittaker.) 10s. 6d
Electricity in Factories and Workshops. By A. P. Haslam. (Lockwood.) 7s. 6d net.
Electric Power Transmission. By Dr. Louis Bell. (Whittaker.) 15s.
Electricity Meters. By Gherhardi. ("Electrician.") 9s.
American Meter Practice. By L. C. Reed. (Spon.) 8s. 6d.

TRACTION AND APPLICATION OF POWER

Electric Propulsion of Ships. By H. M. Hobart. (Harper.) 5s. net.
Electric Trains. By H. M. Hobart. (Harper.) 6s.
Electricity in Mining. By S. F Walker. (Harper.) 9s.
Electric Traction. By Robert H. Smith. (Harper.) 9s
Electric Crane Construction By Claude W. Hill. (Griffin.) 25s. net.
Electrical Practice in Collieries. By D. Burns. (Griffin.) 7s. 6d. net.
Practical Construction of Electric Tramways. By W. R. Bowker. (Spon.) 6s. net
Electric Railway Engineering. By F. H. Parshall and H. M. Hobart. (Constable.) 42s. net.
Theoretical Elements of Electrical Engineering. By C. P. Steinmetz. (Hill Publishing Co.) 17s. net.
Electric Traction. By J. H. Rider. (Whittaker.) 10s. 6d.
Electric Railways and Tramways. By Philip Dawson. ("Engineering.") 42s.

TRANSFORMERS

Principles of the Transformer By Prof. F. Bedell. (Macmillan) 12s. net.
Transformers. By Prof Hermann Bohle and Prof. D. Robertson. (Griffin) 21s. net
Transformers for Single and Multiphase Currents. By G. Kapp. (Whittaker.) 10s. 6d. net.
Alternate Current Transformer. By Dr. J. A. Fleming. ("Electrician.") 2 vols. 12s. 6d. each.

TELEGRAPHY, TELEPHONY, AND CABLES

Elementary Manual of Radiotelegraphy and Radiotelephony for Students and Operators. By J. A. Fleming. (Longmans.) 7s. 6d. net.
Elementary Principles of Wireless Telegraphy. By R. D. Bangay. (Wireless Press, Marconi House.) 1s. 2d, post free.
Experimental Wireless Stations: Their Theory, Design, Construction, and Operation By P. E. Edelmann. (Spon) 6s. 6d. net.
Handbook for Wireless and Inland Telegraph Operators. By Charles Ward. (Rentell.) 1s.
Handbook of Wireless Telegraphy. By Dr. J. Erskine-Murray. (Lockwood.) 10s. 6d. net.
Handbook of Technical Instruction for Wireless Telegraphists. By J. C. Hawkhead. (Wireless Press, Marconi House.) 3s. 6d.
Principles of Electric Wave Telegraphy and Telephony. By J. A. Fleming. (Longmans.) 28s.

Wireless Telegraphy and Hertzian Waves. By S. R. Bottone. (Spon.) 2s. 6d. net.
Textbook of Wireless Telegraphy. By Rupert Stanley. (Longmans.) 7s 6d. net.
Wireless Telegraphy. By W. H. Marchant (Whittaker.) 5s. net.

MUSIC

Embracing Elocution and Singing

Music: How it Came to be What it is. By Hannah Smith. John Murray .. .. .. 5s. net
In eleven chapters the author lightly surveys the progress of music. After discussing musical acoustics, ancient and mediæval music are interestingly sketched. Then follow accounts of the Belgian school, music in Italy, and modern developments—opera, oratorio, instrumental music, the pianoforte, the orchestra. An attractive elementary treatise.

What is Good Music? By W. J. Henderson. John Murray .. .. 5s. net
The writer, one of the best-known literary exponents of the musical art, describes his work modestly as "Suggestions to persons desirous of cultivating a taste in music." A very readable book.

How Music Developed. By W. J. Henderson. John Murray .. .. 5s. net
A volume in Mr. Murray's "Musical Series" of popular expositions by an experienced writer on many phases of musical theory and practice.

The Great Tone Poets. By Frederick Crowest. Macmillan .. .. 3s. 6d.
A popular introduction of the most notable composers, with an attempt to define what each represented in the evolution of musical expression. Bach, Handel, Haydn, Mozart, Spohr, Beethoven, Weber, Rossini, Schubert, and Mendelssohn are among the musicians sketched.

Oxford History of Music. Edited by W. H. Hadow. 6 vols. Clarendon Press .. 15s. net per vol.
The writers of this valuable work are H. E. Wooldridge, who discusses the Polyphonic Period; Sir Hubert Parry, whose subject is the music of the Seventeenth Century; J. A. Fuller Maitland, the Age of Bach and Handel; the editor himself, who deals with what he calls the Vienna School; and E. Dannreuther—the Romantic Period.

Sound and Music: the Physical Constitution of Musical Sounds and Harmony. By Sedley Taylor. Macmillan .. .. 8s. 6d.
The writer summarises his book as "an elementary treatise on the physical constitution of musical sounds and harmony, including the chief acoustical discoveries of Professor Helmholtz."

Philosophy of Music. By Wm. Pole. Kegan Paul. 7s. 6d.
A book that has gone through several editions deservedly, as it puts scientific explanations of musical facts into forms easily understood.

The Rhythm of Modern Music. By C. F. A. Williams. Macmillan .. .. 5s. net
A popularly written book, dealing with the subject from the point of view of the lover of music rather than of the student of science. The musical examples introduced add brightness and illustrate admirably the writer's points.

Grove's Dictionary of Music and Musicians. 5 vols. Macmillan .. .. 105s. net.
The standard work in English on every phase of music, its history, art, instruments, and exponents. On every point it presents an exhaustive bibliography as well as authoritative opinion.

A Great History of Music. By W. S. Rockstro. Sampson Low .. .. 14s.
A valuable work tracing the growth of music from the days of classical Greece until towards the close of the nineteenth century.

The Musical Faculty: its Origins and Processes. By William Wallace. Macmillan .. 5s. net
The writer has devoted much thought to the question of the "Musical Sense," and how it has been developed in the race and develops in the individual. A suggestive book.

The Evolution of the Art of Music. By Sir C. H. Parry. Kegan Paul .. .. .. 5s.
An exceedingly well written and informing summary, continuing down to quite recent times. One of the best of the shorter compendiums of the history of musical art.

The Theory of Sound in its Relation to Music. By Pietro Blaserna. Kegan Paul .. .. 5s.
In this volume of the International Science Series the author tries to lay down the scientific basis of music as a foundation on which the art of the musician can build.

The Story of British Music. By F. Crowest. Macmillan .. .. 15s.
This useful book, by an enthusiastic writer on musical topics, covers the development of British music from the earliest times to the Tudor period.

Modern Composers of Europe. By A. Elson. Pitman .. .. 6s. net
An up-to-date book that deals with the most recent changes in musical fashion, and sketches the men who make the music of today. Full of information that is supplementary to older books.

A Cyclopædic Dictionary of Music. By R. Dunstan. Curwen .. .. 7s. 6d. net
This volume is for the most part an explanation of musical terms. As such it is singularly complete. There are no extended comments.

Music: Its Laws and Evolution. By J. Combarieu. Kegan Paul .. .. 5s.
Written in four parts, dealing with musical thought and psychology; music and social life; musical thought and physiology; and musical thought and the laws of Nature. The author defines music as the art of thinking in sounds.

Old English Popular Music. By William Chappell. 2 vols. Macmillan .. .. 42s. net
A monumental work, containing the harmonised music of more than 300 old English songs, ballads, and dance tunes, with the words and critical comments. The harmonies, originally by Sir G. A. Macfarren, have been revised for this edition. A classical work of the highest value.

About Music and What it is Made Of. By Oliveria Prescott. Methuen .. .. 2s. 6d. net
A very readable popular account of the rise of music as it is now known.

Living Masters of Music. Edited by Rosa Newmarch. 10 vols. Lane. .. 2s. 6d. net each vol.
The "masters" included in this series of monographs are Sir Henry Wood, Sir Edward Elgar, Richard Strauss, Paderewski, Alfred Bruneau, Joachim, Theodore Leschetizky, E. A. MacDowell, Giacomo Puccini, and Debussy. The list, it will be seen, is thoroughly cosmopolitan. The writers include Rosa Newmarch, Ernest Newman, J. A. Fuller-Maitland, and E. A. Baughan.

The Art of the Musician. By Henry G. Hanchett. Macmillan .. .. 6s. 6d. net
A book that meets a clear need. It emphasises the distinction between the real study of music and the study of the arts of playing and singing, and aims at helping those who wish to understand the aims of a composer and the methods of his work. In short, it attempts to tell why musical critics approve of some compositions and disapprove of others.

ASTRONOMY

A Popular Guide to the Heavens. By Sir Robert S. Ball. Illustrated. Philip .. .. 15s. net
This excellent book for beginners and amateurs contains 83 full-page plates, many coloured, being charts of the sun, moon, planetary systems, tides, seasons, comets, nebulæ, the Pleiades, the Milky Way, etc., as well as sectional maps showing the constellations. The plates are beautiful and clear.

Astronomy. By Arthur R. Hinks. 256 pages. Williams & Norgate .. .. 1s.
The author, who is chief assistant at Cambridge Observatory, gives a short sketch of the present condition of astronomical knowledge in relation to the sun, moon, planets, comets, meteors, stars, nebulæ, the Milky Way, and the law of gravity. The methods of observation are explained, and the uses of astronomy in daily life described.

Astronomy of Today. By C. G. J. Dolmage. 363 pages. Illustrated. Seeley .. .. 5s. net
A popular yet truly scientific work, dealing with the whole subject in the light of recent discoveries, and in language free from technical expressions. Describes the sun, moon, and planets; comets and meteors; the stars and their system, and the structure of the heavens. Ancient astronomical theories and the principles of telescopic observation are also explained.

Astronomy. By Frank Watson Dyson. 247 pages. Dent .. .. 2s. 6d. net
This little book, by the Astronomer Royal of Greenwich, is intended to present to the ordinary reader the principles and methods upon which astronomers proceed, and the reasons for some of the important propositions they advance. The author discusses ancient astronomy and astronomical instruments at some length, and then proceeds to speak of the sun, the solar system, stars of all kinds, nebulæ, and the sidereal universe.

Textbook of General Astronomy. By Charles A. Young. 630 pages. Illustrated. Ginn. 12s. 6d.
The best general textbook, being an introduction to the whole subject. Explains the principles of astronomical science and observation; the methods and instruments of practical astronomy; and treats of the movements of the heavenly bodies.

A Primer of Astronomy. By Sir Robert S. Ball. Illus. Cambridge University Press. 1s. 6d. net
A good elementary textbook for beginners and for schools. The author treats of the earth; sun, moon, and planets; gravitation; comets, meteors, etc.; stars and nebulæ. Many excellent illustrations and diagrams.

Astronomical Discovery. By Herbert H. Turner. 225 pages. Arnold .. .. .. 10s. 6d.
The following discoveries are here considered in their relation to, and bearing upon, astronomy in general: (1) Uranus and Eros; (2) Neptune; (3) Bradley's discoveries of aberration and nutation; (4) accidental discoveries; (5) the sun-spot period; (6) the variation of latitude. The chapter on Bradley is particularly pleasing, especially the picture of the astronomer Pound, Bradley's uncle.

Astronomy. By G. F. Chambers. 335 pages. Illustrated. Hutchinson .. .. ..5s. net
An excellent popular outline of the whole subject. Not a formal treatise nor an educational textbook. Designed especially for use with a telescope of two or three inches aperture.

History of the Planetary Systems. By John Louis Emil Dreyer. Cam. Univ. Press .. 10s. 6d. net
This book is a profound and interesting study of the progress of astronomical knowledge and theory. It traces the history of thought from Thales to Kepler, by whom the Copernican system was established on a firm and scientifically demonstrated basis. The study of the older systems is peculiarly clear and sympathetic.

The Life of the Universe. By Svante Arrhenius. Two volumes. Harper .. .. .. 5s. net
A history of evolution theories, which shows "how the grand speculations of our age have been evolved from the primitive, child-like, and inherent notions of our ancestors in bygone ages," so that we trace the rudiments of our modern theories from the shadowy notions of antiquity.

The Growth of a Planet. By Edwin Sharpe Grew. 351 pages. Illustrated. Methuen .. .. 6s.
In this work the author brings together the modern theories, astronomical, physical, geological, geographical, and biological, as to the origin, formation, and growth of the members of the solar system. The "spiral hypothesis" of development from spiral nebulæ is adopted by the author, who traces the history of the nebulous knot through various stages up to the point in habitation by organic life at which man appears.

The Birth of Worlds and Systems. By A. W. Bickerton. 162 pages. Harpers .. .. 2s. 6d. net
A short and popular work on a new theory of the death and regeneration of the parts of the universe. Professor Bickerton thinks that dead suns partly collide, and give rise to new, fiery stars. The light gases given off by worlds collect in space and form a sort of star mist, and attract dead, burnt-out suns, and new systems are thus born.

The Evolution of Worlds. By Percival Lowell. 262 pages. Illustrated. Macmillan. 10s. 6d. net
Describes the birth of a solar system in connection with the appearance of a new star. Tells the story of the initial disaster that occurred to our own system, explains the formation of planets in their self-sustained and sun-sustained stages, and deals with the events that lead to the death of a world.

Two New Worlds. By E. E. Fournier d'Albe. 159 pages. Longmans .. .. .. 3s. 6d. net
An attempt to penetrate the mystery of space and time, with the help of the most modern resources of scientific research. The main thesis is that a universe on a similar pattern to ours exists on a very small scale, and another on a much larger scale—the one being the minute world in which atoms and electrons stand for suns and planets, and the other stellar systems beyond the Milky Way.

The Stars: A Study of the Universe. By Simon Newcomb. 333 pages. Illus. Murray. 6s. net
In this volume the author attempts to sketch, in simple language for the average reader, the wonderful advances of our generation in the knowledge of the fixed stars. He admits that to do this without entering into technical details, and yet to retain precision of statement, is next to impossible, but he succeeds in giving a striking general survey of recent knowledge.

Other Suns than Ours. By Richard A. Proctor. 419 pages. Illustrated. Longmans .. ..3s. 6d.
A series of popular discussions on suns—old, young, and dead. Deals with new stars, the birth of worlds, the origin of comets, and other astronomical subjects but includes scientific essays on various topics.

Worlds in the Making. By Svante Arrhenius. Harper .. .. 6s. net
In this book the director of the physico-chemical Nobel Institute of Stockholm attacks the problem of the evolution of the universe. He endeavours to show how nebulæ may originate from suns and suns from nebulæ, and assumes that this change has always been proceeding as it is now. His guiding principle is the conviction that the universe, in essence, has always been what it is, and matter, energy, and life have only varied as to shape and position in space.

Other Worlds than Ours. By Richard A. Proctor. 318 pages. Illustrated. Longmans. 3s. 6d.
A discussion of the problem of the plurality of worlds, in the light of scientific researches. Propounds views differing from those usually accepted, and comes to the conclusion that the number of inhabited worlds in the universe must be small.

The Solar System. By Charles Lane Poor. 310 pages. Illustrated. John Murray .. 6s. net
This book gives an account of the recent additions to our knowledge of the solar system. Considerable space is devoted to the study of the tides and of tidal evolution; also to the problems connected with the planet Mars. The sun, the moon, the planetary motions, satellite systems, comets, meteors, the evolution of the solar system, and a careful exposition of the "spiral hypothesis" are included.

The Sun's Place in Nature. By Sir Norman Lockyer. 360 pages. Macmillan .. .. .. 12s.
Gives a first-hand account of one of the most wonderful discoveries in chemistry—the element helium—and tells how it was afterwards found on our planet. Discusses the sun's place among the stars, and the origin of new stars, in connection with the author's meteoric theory.

The Sun. By Charles G. Abbot. 448 pages. Illustrated. Appleton .. .. .. 7s. 6d. net
This book, by one of the leading American astronomers, is a record of the discoveries of the last fifteen years or so with regard to the sun, which is treated under three chief aspects—(1) as the controlling member of the solar system; (2) in its own nature, especially as the nearest star, and typical of many stars; (3) as the fountain of light and heat, and so of life on the earth. Also gives an account of methods and principles of solar research.

Total Eclipses of the Sun. By Mabel L. Todd. 285 pages. Illustrated. Sampson, Low .. 8s. 6d.
A book written for the general reader, in non-technical language, explaining why eclipses occur, commenting on examples of the past and present, with a forecast of what may be expected during the next sixty years.

Eclipses. By G. F. Chambers. 254 pages. Illustrated. Hodder & Stoughton .. .. 1s. net
A little work giving all that the general reader needs to know about eclipses of the sun and moon, transits and occultations.

The Starry Skies. By Agnes Giberne. 242 pages. Illustrated. Seeley .. ..1s. 6d.
A famous little primer of astronomy, divided into lessons, with questions at the end of each. An elementary textbook, suitable for children.

The Moon. By William Henry Pickering. Illustrated. Double-demy. Page & Co. .. £2 10s. This book contains over a hundred full-page plates, including 84 most beautiful photographs, forming a complete atlas of the moon. The page being very large, the plates are exceptionally valuable and beautiful. Only the more recent advances in the knowledge of the moon are dealt with.

The Moon. By James Nasmyth and James Carpenter. 213 pages. Illustrated. Murray .. 5s. net For many years the standard work on the subject; now needs to be supplemented by a modern treatise, such as Professor Pickering's. The moon is considered as a planet, as a world, and as a satellite.

The Moon. By Richard A. Proctor. 315 pages. Illustrated. Longmans .. .. .. 3s. 6d. The motions, aspect, scenery, and physical condition of the moon are here presented with the mixture of graphic writing and mathematical proofs which the author so exceptionally combined. An indexed map of the moon, identifying all her features, is usefully included.

The Tides. By Sir George Howard Darwin. 437 pages. Illustrated. John Murray .. 7s. 6d. net The standard work on this interesting subject, treating of the practical methods of observing and predicting the tides, and showing the degree of success which it is possible to obtain in predictions. The account, while being thoroughly scientific, is eminently clear and readable, and not technical. Later chapters deal with several problems of speculative astronomy, such as cosmical time, Saturn's rings, and the origin of double stars.

The Story of the Comets. By G. F. Chambers. 256 pages. Illustrated. Clarendon Press. 6s. net The best popular account of comets and meteors, dealing with every aspect of the subject. A good bibliography.

The Stars. By G. F. Chambers. 192 pages. Illustrated. Hodder & Stoughton .. 1s. net A popular introduction to the stars, their brilliancy and distance, number, movements, and relations with one another, and to all the varieties of stars and nebulæ now known; for those, especially, who do not so far know them. The author tells of double stars, coloured stars, temporary stars, variable stars, groups of stars, clusters of stars, nebulæ, the Milky Way, and, finally, of the stars and nebulæ as known to the spectroscope. A table of the constellations is given in the appendix, as also a list of objects to be seen in small telescopes.

Mars and its Canals. By Percival Lowell. 384 pages. Illustrated. Macmillan .. 10s. 6d. net This popular work gives the history of discoveries with regard to Mars, which have followed one another from 1840 to the present day; describes the chief surface features of the planet, such as the polar caps, and discusses its probable climate. One half of the book is devoted to the "canals," which Mr. Lowell believes to be watercourses surrounded with vegetation. He brings forward strong evidence that these are the work of intelligent beings.

Through the Telescope. By Rev. J. Baikie. 292 pages. Illustrated. Black .. .. .. 5s. An excellent introduction to astronomy, with special reference to practical study of the heavens with small and inexpensive telescopes. The language is simple, and the book is intelligible throughout to any person of ordinary education. The illustrations represent for the most part the results of the best modern instruments, but a few are included to show the work of small telescopes.

The Meteoritic Hypothesis. By Sir Norman Lockyer. 559 pages. Illustrated. Macmillan. 17s. net Contends that many so-called stars are swarms of meteorites, and that all self-luminous bodies in the celestial spaces are composed either of swarms of meteorites or of masses of meteoritic vapour, produced by heat, while many solar phenomena are produced by the fall of meteorites upon the surface of the sun.

Man's Place in the Universe. By Alfred Russel Wallace. 341 pages. Chapman & Hall. 6s. An unorthodox book by a great man, contending that the earth holds practically a central position in the universe, that this position has been favourable, and perhaps essential, to the development of life on the earth, and that earth is the only inhabited world. Dr. Wallace discusses the results of scientific research in relation to the unity or plurality of worlds, and considers such questions as: Are the stars infinite? our relation to the Milky Way; physical conditions of life; are the stars useful to us? and so on, and in later editions he has added a chapter supporting his theory by arguments from evolution—upon which subject he must, of course, be held a supreme authority. Dr. Wallace's conclusions on this subject are not generally accepted, and they clearly challenge views now widely held as to the possibility of life in other worlds; but the theory of this volume is enthralling in its human interest, and the right of the author to be heard is beyond all question.

The Astronomy of the Bible. By E. W. Maunder. Hodder & Stoughton .. .. .. 5s. net A most interesting book, written with a wise sympathy. The author deals astronomically with the many astronomical allusions in the Bible, but endeavours to see the heavens with the eyes of the patriarchs and prophets, and so understand their attitude towards them.

Myths and Marvels of Astronomy. By R. A. Proctor. (Longmans.) 3s. 6d.

Saturn and Its System. By R. A. Proctor. (Chatto & Windus.) 6s.

Astronomy without a Telescope. By E. W. Maunder. (Thacker.) 5s.

Celestial Objects for Common Telescopes. By J. W. Webb. (Longmans.) 12s. 6d.

Astronomy with an Opera-glass. By Garrett P. Serviss. (Appleton.) 6s.

Handbook of Descriptive Astronomy. By G. F. Chambers. (Clarendon Press.) 3 vols. 32s. net.

The Visible Universe. By J. E. Gore. (Lockwood.) 16s.

Studies in Astronomy. By J. E. Gore. (Chatto.) 6s.

GEOLOGY

See also under Geography.

The Student's Lyell: Principles and Methods of Geology. 645 pp. Illus. John Murray .. 7s. 6d. net An epoch-making work in the history of geological science. Sir Charles Lyell was the pioneer of the theory that the changes still in progress are chiefly such as have produced the former changes of the earth's surface, and in this volume covers the whole ground of geology, as known in his day, in the light of this principle. Besides dealing with the face of the earth, Lyell treats of climate and of astronomical changes in their relation to the earth's features; of aqueous and glacial causes of change; of rivers, tides, and currents; of igneous causes, etc. He also deals with flora and fauna, the antiquity of man, the origin of species, and a host of other interesting and kindred subjects.

Textbook of Geology. By Sir Archibald Geikie. Two vols. Illustrated. Macmillan .. .. 30s.
The best work by any British author, reviewing the whole of geology. Though very learned, it is simple and readable; the author's great interest in scenery always makes his work attractive. The chief divisions of the book are: The cosmical aspects of geology; geognosy, or the inquiry into the materials of the earth's substance; dynamical geology; structural geology; palæontological geology; stratigraphical geology; physiographical geology. There is a good bibliography, and a list of geological maps of all parts of the world.

Geology. By Thomas C. Chamberlin and Rollin D. Salisbury. Three vols. Illustrated. John Murray 21s. net each.
A brilliant American work, in which the authors approach the science by a study of the forces and processes now in operation. Encumbered as little as possible by technicalities and unimportant details, but immense in sweep, and intimate in style. Rather too large a work for a general reader to start on, but very valuable and stimulating to advanced students. There is a shorter course in one volume at 21s. net.

An Introduction to Geology. By J. E. Marr. Illustrated. Cambridge University Press .. 3s. net
An attempt to explain the scope and methods of geology without using technical terms or taxing the reader's memory with excess of detail. Useful to general readers who wish to obtain some idea of the science, and especially instructive to the student who intends to proceed to the reading of more advanced treatises.

Classbook of Geology. By Sir Archibald Geikie. 475 pages. Illustrated. Macmillan .. 5s.
The standard introductory work on the study of the structure of the earth. Clearly and simply written, and suitable for the general reader as well as for the young student.

Outlines of Geology. By James Geikie. 436 pages. Illustrated. Stanford .. .. .. 12s.
An introduction for general readers. The parts which the beginner usually finds difficult are treated in greater detail. Gives a broad view of the scope and bearing of the science, with a table of British strata in which fossils are found, and a glossary.

The Founders of Geology. By Sir Archibald Geikie. 497 pages. Macmillan .. .. .. 10s. net
A history of the development of geological science in the form of a series of life-stories of the pioneers and masters of geology. Combines brilliance of style with solidity of thought.

The Student's Handbook of Stratigraphical Geology. By A. J. Jukes-Browne. Stanford .. 12s. net
Consists chiefly of the description of the great stratified series of rocks that make up the mass of the earth's crust. Gives the history of the earth as revealed in the fossil life of each stratum after the earliest rocks. A first-rate handbook.

Earth Sculpture; or the Origin of Land Forms. By James Geikie. 336 pp. Illus. John Murray.. 6s.
A simple but scientific account, for general readers, of the processes by which the land is carved out and moulded and changed by internal fires and glaciers of the Ice Age. An authoritative study of the origin of scenery.

Building of the British Isles. By A. J. Jukes-Browne. Stanford .. .. .. 12s. net
An admirable picture of how the British Islands have come to be what they now are through æons of change. Most valuable.

Structural and Field Geology. By James Geikie. 452 pages. Illus. Oliver & Boyd.. 12s. 6d. net
For beginners in field geology. Deals with rock-forming minerals, rocks, fossils; and the formation of rock-beds, ore-formation, geological surveying, and the industrial and practical aspects of geological structure are explained in some detail. Chapters on soils and subsoils and surface features.

The Work of Rain and Rivers. By T. G. Bonney. Illustrated. Cambridge University Press. 1s. net
Dr. Bonney has written this short account of the work of rain and rivers in such a way as to apply the principles of this branch of geology to the interpretation of scenery. The book is particularly interesting to readers who have travelled, for the illustrations are all drawn from familiar districts.

River Development. By I. C. Russell. 327 pages. Illustrated. John Murray .. .. 6s. net
An admirable study of rivers, illustrated generally by the rivers of North America. The book deals with the disintegration and decay of rocks, laws governing streams, and river deposits.

Cloud Studies. By Arthur W. Clayden. 184 pages. Illustrated. John Murray .. .. .. 12s.
Intended primarily for students of weather-lore and artists, but interesting to all lovers of Nature. Explains the details of cloud structure, and describes and depicts typical varieties of cloud forms. Aims at introducing a greater exactness of language in description. Has a chapter on cloud photography.

Climatic Control. By L. C. W. Bonacina. 167 pages. Illustrated. Black .. .. 2s.
A simple discussion in textbook form of the general principles of climatology, showing how vegetation and other features of the landscape are controlled by climatic influences, and how such influences modify the life of man and his occupations. One of the objects of the writer is to induce the student to observe the climate on his own account, and form his own theories.

The Face of the Earth. By Edward Suess. Four volumes. Clarendon Press .. .. £4 13s. net
The most complete and definite of all the general surveys of geological facts. It embodies the results of personal research, and a study of the work of the leading geologists of all lands, and it approaches nearer absolute comprehensiveness and authority than any similar work in any language.

The Age of Earth. By Arthur Holmes. 196 pages. Illustrated. Harper .. .. .. 2s. 6d. net
Approaches the subject from various sides, dealing with tidal effects, the saltness and age of the oceans, the work of denudation, and the time required for the formation of sedimentary rocks. Discusses the new factor of radio-active substances, which has upset both mathematicians and geologists.

The Story of the Hills. By Rev. H. N. Hutchinson. 356 pages. Illustrated. Seeley .. .. 5s.
In this book the author sets out to tell, in a popular manner, the story of mountains and how they were made, having in mind the thousands who are now able to visit the mountains of Europe during their holidays, and the ladies who climb Mont Blanc or wander among the Carpathians. For such readers the scientific facts and history of mountains are genially rendered in this excellent work.

The Glaciers of the Alps. By John Tyndall. 270 pages. Dent .. .. 1s. net
Professor Tyndall's vivid descriptions of the Alps and of mountaineering are attractive not only because of their scientific value, but also for their interest in scenery and in climbing.

The Romance of Modern Geology. By E. S. Grew. 308 pages. Illustrated. Seeley .. .. 5s.
An account in simple language of the building of the earth, and of the various processes which have been at work producing its present features, with some account, in an interesting manner, of prehistoric animals. Suitable for children over fourteen, and for older readers who are not specialists.

The Making of the Earth. By J. W. Gregory. 256 pages. With maps. Williams & Norgate. 1s.
The sum of evidence as to the origin of the earth, provided by the latest astronomical, geological, palæontological, zoological, and geographical researches is here brought together. The last chapter is a consideration of the origin of life, which the author defines as the problem of "the formation of a self-generating, reproductive, carbonaceous jelly, of such a nature that it served as the beginning of the whole of the organic evolution that followed."

The World's Foundation. By Agnes Giberne. 315 pages. Illustrated. Seeley .. .. .. 5s.
A popular book on geology, for beginners. Would do for children above fourteen.

History of Geology and Palæontology. By K. von Zittel. 362 pages. Portraits. Walter Scott. 6s.
No science has had a more rapid and changeful growth than geology. That growth to the end of the nineteenth century is here traced by the distinguished Professor of Geology in the University of Munich, with remarkably wide knowledge and a complete acquaintance with the personal story that is interwoven with the development of the science. Dr. von Zittel not only tells how the knowledge is accumulated, but, step by step, names the people who have been its collectors. An invaluable book.

The Earth in Past Ages. By H. G. Seeley. 196 pages. Illustrated. Hodder & Stoughton. 1s.
This useful little book tells the story of the earth in the past in such a manner as to explain its present condition. It explains the nature of the common materials which form rocks, the ways in which they rest on one another, and the means by which they may be distinguished. Fossil remains are explained in a similar manner.

Physiography. By Thomas Henry Huxley. Illustrated. Macmillan .. .. 4s. 6d.
An introduction to the study of Nature, by a masterhand. Deals principally with the forces at work in a great river basin, setting out from the commonest and best-known phenomena, such as clouds and rain, dew and ice, and going on to the study of living matter, the movements of the earth, the sun, and gravitation. A standard scientific exposition, recently revised in the light of the latest researches.

Man and the Glacial Period. By G. Frederick Wright. 385 pages. Illustrated. Kegan Paul. 5s.
The author summarises the position of existing glaciers; discusses glacial motion, and signs of past glaciation; locates the ancient glaciers of both hemispheres, and outlines their drainage systems; points out where the relics of man are found in connection with the glacial period, and debates the cause and date of that period.

The Scenery of Scotland Viewed in Connection with its Physical Geology. By Sir Archibald Geikie. 560 pages. Illustrated. Macmillan .. 10s. net
Begins by describing the general processes by which land is sculptured into changing shapes, and then gives particular examples of the work, of geological forces in the highlands, the southern uplands, and the valleys in the midlands.

Ice-work, Present and Past. By T. G. Bonney. 295 pages. Illustrated. Kegan Paul .. .. 5s.
An interesting book because of its distinct aim and individuality. Professor Bonney here tries to give prominence to all those facts of glacial geology on which all inferences must be founded, and he selects for description such phenomena as he has examined personally, assuming in all controversial matters, he claims, the attitude of a judge rather than of an advocate. The result is a fine collection of materials for forming a judgment as to the part played by ice in the story of the world.

The Forms of Water in Clouds and Rivers, Ice and Glaciers. By John Tyndall. Kegan Paul. 5s.
A brilliant and well-known work. Sets out from the waves of heat that produce the vapour of the atmosphere; deals with tropical rains; the condensation by mountains; the architecture of snow and ice, and the formation and motion of glaciers.

The Scenery of England, and the Causes to which it is Due. By Lord Avebury. Macmillan .. 6s.
Attributes the configuration of England, and consequently the scenery, mainly to sub-aerial action. A work on the principles of geology, written in a fresh and vivid manner. Deals with the Great Ice Age, the sculpture of the coast, the origin of the mountains and lakes, and the history of English rivers, fens, downs, and commons.

The Scientific Study of Scenery. By John E. Marr. 372 pages. Illustrated. Methuen .. .. 6s.
This book is intended as an introduction to the scientific study of the existing features of earth, sea, and sky which are visible to the eye; it deals chiefly with the attribute of form and its causes, but also with colour, movement, and character of surface.

Landscape in History, and Other Essays. By Sir Archibald Geikie. Macmillan. .. 8s. 6d. net
Half of the essays deal with scenery in its relation to geological events, and in its influence on human progress; the work brings home to the mind in a vivid way the value of geology.

The Scenery of Switzerland. By Lord Avebury. 473 pages. Illustrated. Maps. Macmillan. 6s.
A brilliant little book on the geological processes which have been at work in producing the Swiss scenery. Lord Avebury, who travelled in Switzerland in the company of Tyndall and Huxley, and later spent many holidays in the Alps, had a keen eye for natural grandeur and beauty, and succeeded in showing how the physical features of the country are produced and how they are changing.

The Origin of Earthquakes. By C. Davison. 141 pages. Illus. Cambridge Univ. Press. 1s. net
This book considers the origin of different classes of earthquakes, and describes fully one or two examples of each class. The growth of "faults" is discussed; then the origin of simple earthquakes; twin earthquakes; complex earthquakes; fore-shocks; after-shocks; and, finally, sympathetic earthquakes.

Earthquakes and other Earth Movements. By John Milne. 361 pages. Illustrated. Kegan Paul. 5s.
Professor Milne was the founder of the science of earthquakes, and the inventor of the instrument for recording earth movements. His work is written in a clear and authoritative manner, and is not too difficult for the general reader.

The Geology of Building Stones. By J. Allen Howe. 455 pages. Illustrated. Arnold .. 7s. 6d. net
A practical book of reference for architects and students of geology. Gives a list of the principal granite, sandstone, limestone, and slate quarries, and deals generally with our building stone resources.

A Study of Recent Earthquakes. By Charles Davison. Illustrated. Walter Scott .. 6s. An interesting collection of accounts of earthquakes in all parts of the world, covering very wide ground, and bringing together facts not previously collected in one volume. The final chapter gives a summary of the results of earthquake study.

The Physics of Earthquake Phenomena. By C. G. Knott. Illustrated. Clarendon Press. 14s. net The author, who has been Professor of Physics in the Imperial University of Japan, has had special facilities for studying earthquakes, and adds personal investigation to a very complete knowledge of the literature of the subject. A thoughtful book for advanced students.

Volcanoes and Earthquakes. By E. J. Houston. 325 pages. Illustrated. Chambers .. 2s. 6d. An account of some of the most memorable volcanic eruptions and earthquake shocks, from the destruction of Pompeii to the destruction of San Francisco. Descriptions are given of the best-known groups of volcanoes. There are chapters, too, on submarine volcanoes and the extinct volcanoes of the moon. A popular treatment of the subject.

Volcanoes Past and Present. By Edward Hull. 270 pages. Illustrated. Walter Scott .. 3s. 6d. A popular account of the volcanic and seismic phenomena of the globe as manifested in certain notable eruptions. The book endeavours to find an answer to two important questions: Are we living in an epoch of extraordinary volcanic energy? and What is the ultimate cause of volcanic action?

Volcanoes. By John W. Judd. 381 pages. Illustrated. Kegan Paul .. .. .. 5s. A popular exposition of the present condition of knowledge respecting volcanoes, with an account of investigations that in recent times have thrown fresh light on the whole problem. These investigations include the character of lavas, as revealed by microscopic examination; the nature and movements of liquids enclosed in the crystals of igneous rocks, and the relation of minerals in volcanic products to those found in meteorites.

Volcanoes: their Structure and Significance. By T. G. Bonney. 378 pages. Illus. John Murray. 6s. A simply written but authoritative book on the subject. Describes the activities of a living volcano from birth to death. Deals with the geological history of volcanoes in the past and present. A general survey of the problems of volcanic action.

Coal and What We Get From It. By Raphael Meldola. Illustrated. S.P.C.K. .. .. .. 2s. 6d. To the reader who is unaware what a variety of useful products are obtained from coal by modern industry, this book, by the Professor of Chemistry at the Finsbury Technical College, will come as an astonishing revelation. Specially interesting are the processes by which brilliant dyes are obtained.

The Geology of Coal and Coal-Mining. By Walcot Gibson. Illus. 341 pages. Arnold. 7s. 6d. net Deals in an elementary manner with the strictly scientific side of the subject, and explains all the geological terms used by miners. Describes formation and origin of coal, the art of prospecting and boring, and surveys the coalfields of Britain at length, and the coalfields of the rest of the world in a more concise manner.

Our Common British Fossils. By J. E. Taylor. 331 pages. Illustrated. Routledge .. 3s. 6d. A handy book for young students, dealing only with invertebrate fossil animals—the most numerous class of all.

Textbook of Petrology. By F. H. Hatch and R. H. Rastall. 2 vols. Allen & Unwin. 7s. 6d. net each. A very valuable but highly scientific description of the sediments and their metamorphic derivatives. A useful contribution to a branch of geology which has perhaps been rather neglected. There is a most useful appendix, in which Mr. T. Crook summarises the modern methods of separating and determining the minerals occurring in clays, sands, and soils.

The Natural History of Clay. By A. B. Searle. 176 pages. Illus. Cambridge University Press. 1s. net Though clay is so useful, and long has been, we know little of its properties when in a pure state. This volume outlines what is known, and indicates unsolved problems. For instance, many clays owe their chief value to plasticity, but plasticity is of an elusive nature, and almost defies measurement.

The Old Red Sandstone. By Hugh Miller. 363 pages. Dent .. .. 1s. net The story of how the author found fossils in the lower old red sandstone, and fixed in the geological scale the place to which the larger beds of remains found in the system belong. Some of the work of Miller has been superseded by later experience, but his book will always live, because of the imaginative power he used in picturing the vanished past.

Crystalline Structure and Chemical Constitution. By A. E. H. Tutton. 204 pages. Illustrated. Macmillan .. .. 5s. net Presenting, in a concise manner, the author's original contributions to the problem of the relation between the form, structure, and physical properties of crystals and the chemical composition of the substances composing them.

Rocks and their Origins. By G. A. J. Cole. 175 pages. Illus. Cambridge University Press. 1s. net An introduction to geology for the general reader, discussing simply and clearly, first, rocks in general, and then, in separate chapters, limestones, sandstones, clays and slates, igneous rocks, and metamorphic rocks. There is a useful bibliographical reference table.

Petrology for Students: Study of Rocks under the Microscope. By Alfred Harker. 336 pages. Illustrated. Cambridge University Press .. 7s. 6d. A guide to the study of rocks in thin slices, that needs to be supplemented throughout by demonstrations on actual specimens. Designed for English-speaking students, and dealing with British, American, and Colonial rocks. A useful book on a comparatively new study.

The Natural History of Igneous Rocks. By Alfred Harker. 384 pages. Illus. Methuen. 12s. 6d. net This book contains the substance of a course of lectures by the author, who is Professor of Petrology in the University of Cambridge. It is a work for serious students, but eminently readable. Igneous action and igneous rocks are first considered from a geological standpoint, and brought into their proper relation with other parts of historical geology. The middle part of the book deals with the crystallisation of igneous rock-magmas. Finally, the genesis of igneous rocks is considered, and in the last chapter a natural classification is attempted.

Extinct Animals. By Sir E. Ray Lankester. 354 pages. Illustrated. Constable .. .. 3s. 6d. A vivid and brilliant attempt to describe the vanished monsters and strange creatures that once inhabited our earth. Written by a leading man of science of the day, who combines a talent for literature with a remarkable range of knowledge, this is one of the best popular books on the subject.

Natural History of Coal. By E. A. N. Arber. 156 pages. Illus. Cambridge University Press. 1s. net
There was a time when scientific men regarded the natural history of coal as a simple matter. Not so now. It is crowded with unsolved problems. This Mr. Arber realises. He sees that all types of coal were not derived from the same type of "mother substance." So he does not dogmatise, but states theories fairly, while considering the conditions under which different coals have accumulated.

The Geology of Water-Supply. By Horace B. Woodward. 339 pages. Illustrated. Arnold. 7s. 6d.
Deals with the knowledge of the geological structure of the ground and the character of rock-formation necessary in obtaining an adequate supply of potable water. Study of water-bearing strata, springs, underground sources, with a chapter on prospecting for water. Written with special reference to Great Britain, but touches other water supplies.

Extinct Monsters and Creatures of Other Days. By Rev. H. Hutchinson. Chapman & Hall. 10s. 6d.
This book, with a companion volume on "Extinct Monsters," by the same author and publishers, forms an admirable survey of the old-time creatures that have passed away from the earth. The whole of the knowledge in these volumes is practically the outcome of the research of the last two generations, and the story of these "lost creations" is in itself fascinating reading, while throwing light also on the early history of living things.

ARCHAEOLOGY

See also under History, Ancient and Social Evolution.

A Bibliographical List of Roman and British Architectural Remains. By Arthur H. Lyell. Cambridge University Press .. .. 7s. 6d. net
In this list—which is only a list and not a book of comment—the compiler mentions all antiquarian excavations of the Romano-British period, and the books or journals in which the results of the excavations are recorded.

A Century of Archæological Discoveries. By Prof. Michaelis. John Murray .. .. 12s. net
It is almost impossible to keep a review of archæological research up to date, for the work is carried on constantly over an enormous field. This translation from the German, which has the good word of Professor Percy Gardner of Oxford, brings the story along as far as the Cretan excavations by Evans. The book is a very useful survey up to the beginning of the twentieth century.

The British Museum: Its History and Treasures. By Henry C. Shelley. Pitman .. 12s. 6d. net
The author's summary of his book is "a view of the origins of the British Museum, its early benefactors and principal officers, and a survey of the priceless objects it preserves." The literary work is slight, sketchy, and agreeable, with much quotation.

Archæology and False Antiquities. By Dr. R. Munro. Methuen .. .. .. 7s. 6d. net
In this volume Dr. Munro exposes what he calls "the backwash of archæological imposture." Everywhere the value placed on remains of the distant past has led to attempts at manufacturing relics. Dr. Munro has the kind of mind that distrusts whenever it is asked to jump to a conviction. He proves the great need for scientific reserve.

Brasses of England. By H. W. Macklin. Methuen. 7s. 6d. net
A general survey of the monumental brasses still existing in England. The industry of the writer is on a level with his expertness and enthusiasm.

Parish Life in Mediæval England. By Cardinal Gasquet. Methuen .. .. .. 7s. 6d. net
A fascinating book by a writer who has both great knowledge and literary charm. The topics are the parish, its church, its clergy, the officials, parochial finance, the church services, the festivals, the sacraments, the pulpit. Parish amusements, guilds, and fraternities. The illustrations are many and good.

Parish Registers of England. By J. C. Cox. Methuen .. .. 7s. 6d. net
Dr. Cox has spent half a century in studying parish registers, and the results come with his book. He shows the action of the law on them; their relations to marriages, baptisms, burials, accidents, epidemics, and notable historical and scientific occurrences. A book of solid value and salutary influence.

Romano-British Buildings and Earthworks. By John Ward. Methuen .. .. 7s. 6d. net
This book not only describes the towns, forts, houses, and structural remains of the period it deals with, but attempts to interpret them. It discovers, discusses, and illustrates an astonishing amount of Roman work in our country. The writer proceeds with an impressive confidence.

Mallet: Northern Antiquities. Bell .. 3s. 6d.
Bishop Percy's translation from the French of M. Mallet's "Northern Antiquities" is of lasting interest, partly because it gives much information respecting the early people of Denmark, Norway, Greenland, and Iceland, and partly because it enables us to see the kind of literature which arrested the attention of Scott and other writers who carried on the best traditions of romance.

Ruins of Desert Cathay. By Sir Aurel Stein. 2 vols. Illustrated. Macmillan .. .. 42s. net.
This substantial book is a record of personal experiences during the exploration of the westernmost parts of China and parts of Central Asia. The writer, who is superintendent of the Indian Archæological Survey, is equally experienced as a traveller, an archæologist, and a writer.

Earthwork of England. By A. Hadrian Allcroft. Illustrated. Macmillan .. .. 18s. net
This valuable modest book makes no pretence to cover the whole of the ancient earthworks of England. The writer only describes what he has examined personally; but he uses his observation so as to suggest the systematisation of such works, and the working out of a generally applicable history for them. The book is abundantly illustrated with plans of ancient "works." It is the most comprehensive presentation of the subject in a popular form.

Byways in British Archæology. By Walter Johnson. Illustrated. Cambridge University Press. 10s. 6d.
The writer of this attractive book holds that there is such a thing as a popular or "folk" memory, and that it keeps alive many semi-historical survivals. Examples are here collected with special reference to the village church and churchyard. The building of churches on pagan sites is investigated, and the secular uses of churches in earlier times are illustrated. These and similar questions are discussed with acumen and care. The book has many well-chosen illustrations.

Brasses. By J. S. M. Ward. Cambridge University Press .. .. 1s. net
Aims at giving the general reader a fair idea of the classes into which monumental brasses may most readily be grouped, and enable him to distinguish the salient points of each.

The Care of Ancient Monuments. By G. Baldwin Brown. Cambridge University Press. 7s. 6d. net
The Professor of Fine Arts in the University of Edinburgh here gives an account of the legislative and other measures adopted in European countries for protecting ancient monuments and objects and scenes of natural beauty, and for preserving the aspect of historical cities. He also seeks to establish a fitting æsthetic standard with architecture of towns. The question of "restoration" is also considered. An excellent book.

The Green Roads of England. By R. Hippisley Cox. Methuen .. .. 10s. 6d. net
The "green roads of England" are the travels that follow the watersheds from certain hill centres, and were defended, at frequent intervals, by camps in the Stone Age. These roads are traced by the writer with much sympathetic skill. Beginning with Avebury, the ridgeway from Salisbury Plain to the Mendips is followed. Then Dorsetshire, Hampshire, and Wiltshire are visited, the watersheds of the upper Thames, and the Eastern watershed. The book is of enthralling interest to the antiquarian. The illustrations are adequate.

The Castles and Walled Towns of England. By Alfred Harvey. Methuen .... 7s. 6d. net
The localities of a thousand English castles are known, and more than four hundred exist in a more or less fragmentary condition. These towns are classified by the author and described as they form types. The walled towns are very numerous, but the author has visited all of them. An interesting book, well written and well illustrated.

Ancient Athens. By E. A. Gardner. Macmillan. 21s. net
A complete archæological survey of Athens by an archæologist of the greatest competence, who writes with intimate personal knowledge. Professor Gardner's general tendency, happily, is towards a restraining conservatism—that is, he does not run bareheaded after the latest theories. A handsome book, judiciously written and finely illustrated.

Excavations at Babylon. By R. Koldewey. Macmillan .. .. 21s. net
This book tells of the results of German excavations in Babylon, which, the author claims, have superseded in almost every detail the labours of the earlier excavators, such as Layard, Oppert, and Rassam. The author himself has also constantly altered his opinion as he digged. Evidently the end is not yet. Meantime the book is interesting and handsome, and supremely well illustrated.

Monumental Java. By J. F. Scheltema. Macmillan. 12s. 6d. net
Many people are quite unaware that there are any monumental remains in Java. The writer of this book lived nearly thirty years in the country, and to him it has been a labour of love to describe the Hindoo and Buddhist temples, with their special Javanese architecture and sculpture. The book gains features from its movement through quite unknown scenes. It is fully illustrated.

The Discoveries in Crete. By Ronald M. Burrows. 244 pages. Illustrated. John Murray .. 5s. net
Deals in an attractive and popular way with the digging up of the buried civilisation of the Mediterranean sea-kings, and the bearing of the discoveries on the history of civilised man. Aims at giving a picture of Cretan culture as a whole, and at presenting it to the reader in a manner that will make it alive and real.

Arts and Crafts of Ancient Egypt. By Sir W. M. Flinders Petrie. Foulis .. .. .. 5s. net
A study of the practical life of the people who evolved the earliest civilisation, by the greatest expert in the art of inference from discovered relics. Petrie is as successful in writing as in exploration.

Annual of the British School at Athens. (Macmillan.) 17 vols. £16 0s. 6d.

Handbook to the Greek and Roman Antiquities in the British Museum. By Sir E. T. Cook. (Macmillan.) 10s. net.

The Nine Minoan Periods. By Sir Arthur J. Evans. (Macmillan.) In the press.

LANGUAGE

A Brief History of the English Language. By O. F. Emerson. Macmillan .. .. 4s. 6d. net
Deals with the language entirely from an etymological point of view, showing how it has changed, been added to, and modulated in phonetics and by accent. A very useful book on limited lines.

The English Language. By L. Pearsall Smith. 251 pages. Williams & Norgate .. .. 1s. net
Mr. Pearsall Smith, a student of American birth, but now resident near Oxford, shows in this booklet amazing industry and ingenuity in tracing the meanings of words. Every Englishman who loves his native language will delight in the new view of it given in this book.

English Past and Present. By Richard C. Trench. Routledge .. .. 2s. 6d.
A popular and sound book on the growth of the English tongue and the transmutations it has undergone in receiving words from other languages, and in the meaning and spelling of words. Originally its contents were given in lectures by Archbishop Trench.

The Making of English. By Henry Bradley. Macmillan .. .. 4s. 6d.
The best and most readable work of its kind. Dr. Bradley traces rapidly the growth, receptivity, and changes of the English language, and suggests how it has come to be what it now is. He regards the language as a kind of living organism, constantly undergoing evolution.

A Guide to the English Language. Jack .. 5s. net
Eight contributors have worked under the editorship of Mr. H. C. O'Neill to produce this guide to the history, development, and use of the English language. It contains a great deal of miscellaneous information well worth the price charged.

Introduction to the Science of Language. By A. H. Sayce. 2 vols. Kegan Paul .. .. .. 9s.
A sound work by a philologist of universally admitted and sustained reputation. The book has passed through several editions, and continues to hold its ground.

The Life and Growth of Language. By Wm. D. Whitney. (Kegan Paul.) 5s.
Race and Language. By André Lefèvre. (Kegan Paul.) 5s.
The Science of Language. By F. Max Müller. 2 vols. (Longmans.) 10s.
Words and Places. By Isaac Taylor. (Dent.) 1s.

METALS AND MINERALS

The World's Minerals. By L. J. Spencer. 212 pages. Illustrated. Chambers .. .. 5s.
All the more common, simple minerals are described, and are illustrated on coloured plates. The author has avoided, as far as possible, technical terms, and has used popular language suited for younger students.

Mineralogy. By Sir Henry A. Miers. 584 pages. Illustrated. Macmillan .. .. 25s. net
This "introduction to the scientific study of minerals" is an admirably written and illustrated work, valuable especially with regard to the crystalline structure of minerals. The book will be found interesting by every student of the rocks, and even by the beginner.

Mineralogy. By F. H. Hatch. 253 pages. Illustrated. Whittaker .. .. .. 4s. net
Dealing with the characters of minerals, their classification and description. The first part treats of the forms, physical properties, and chemical composition of minerals; the second part describes the rock-forming groups—the ores, salts, gems, and other varieties. Only those minerals that play an important rôle in the economy of Nature, or are used by man, are described at length.

Gem-Stones and their Distinctive Characters. By G. F. H. Smith. Illustrated. Methuen .. 6s. net
A concise and yet complete account of the characters of the minerals used in jewellery. The author describes fully the methods of determining the chief qualities of gems, so that the reader, even if previously unacquainted with the subject, may have at hand all the information necessary for the identification of any cut stone.

Metallurgy. By H. Wysor. 308 pages. Illustrated. Williams & Norgate .. .. 12s. 6d. net
"A condensed treatise for college students and any desiring a general knowledge of the subject." Text and illustrations are alike excellent.

Pearls. By W. J. Dakin. Cambridge University Press .. .. 1s. net
A summary of the most important facts about pearls, pearl fishing, and pearl formation, avoiding technicalities.

PRICES OF BOOKS

In all cases the prices in this list are the maximum prices, and in many cases, whether indicated or not, there may be a discount of threepence in the shilling. Almost invariably shilling books, and nearly all technical works, are *net*.

A Handbook of Metallurgy. By Carl Schnabel. 2 vols. Macmillan .. .. .. 46s. net
This book contains the best results that German research and experience can offer to the English metallurgist. The translator is the Professor of Mining at Armstrong College, Newcastle.

Coalfields of Great Britain. By Professor Hull. Rees .. .. 7s. 6d. net
Gives a general sketch of the British coalfields and their structure, and also of the resources of the rest of the Empire, and a comparison with those of other countries.

Mines and Minerals of the British Empire. By Ralph G. Stokes. Edward Arnold .. 15s. net
This book is inspired from South Africa. It deals with the more salient industrial conditions of all the mineral-producing sections of the Empire—India, Ceylon, Malaya, Australia, New Zealand, and Canada, as well as South Africa. It is lucidly written and profusely illustrated.

MINERALOGY

Systematic Mineralogy. By Hilary Bauerman. (Longmans.) With illustrations. 6s.
Descriptive Mineralogy. By Hilary Bauerman. With illustrations. (Longmans.) 6s.
Prospecting for Minerals. By S. Herbert Cox. (Griffin.) 5s.
The Cyanide Process of Gold Extraction. By James Park. (Griffin.) 8s. 6d. net.
Mineralogy. By Prof. A. H. Phillips. (Macmillan.) 16s. net.

METALLURGY

Intermetallic Compounds. By Cecil H. Desch. (Longmans.) 3s. net.
Liquid Steel: Its Manufacture and Cost. By David Carnegie and Sidney G. Gladwyn. (Longmans.) 25s. net.
Introduction to Metallography. By Paul Goerens. (Longmans.) 7s. 6d. net.
Non-Ferrous Metals. By Prof. Wm. Gowland. (Griffin.) 18s. net.
Alloys. By Edward F. Law. (Griffin.) 12s. 6d.
Microscopic Analysis of Metals. By Floris Osmond and J. E. Stead. (Griffin.) 8s. 6d. net.
Practical Assaying. By Prof. James Park. (Griffin.) 7s. 6d. net.
Mixed Metals or Metallic Alloys. By Arthur H. Hiorns. (Macmillan.) 6s.
Iron and Steel Manufacture. By Arthur H. Hiorns. (Macmillan.) 3s. 6d.
Metallography. By Arthur H. Hiorns. (Macmillan.) 6s.
A Text-book of Elementary Metallurgy. By A. H. Hiorns. (Macmillan.) 3s.
Principles of Metallurgy. By A. H. Hiorns. (Macmillan.) 6s.
Steel and Iron for Advanced Students. By A. H. Hiorns. (Macmillan.) 10s. 6d.
Practical Metallurgy and Assaying. By A. H. Hiorns. (Macmillan.) 6s.
Metal Colouring and Bronzing. By A. H. Hiorns (Macmillan.) 5s.
An Introduction to the Study of Metallurgy. By Sir W. Roberts-Austen. (Griffin.) 18s. net.
The Metallurgy of Steel. By F. W. Harbord and J. W. Hall. (Griffin.) 2 vols. 36s. net.
The Metallurgy of Iron. By J. Turner. (Griffin.) 16s. net.
Cast Iron. By W. H. Hatfield. (Griffin.) 10s. 6d.
An Introduction to Practical Metallurgy. By Prof. T. Turner. (Griffin.) 3s. net.

A Text-book of Elementary Metallurgy. By A. H. Sexton. (Griffin.) 6s.
Metals, Their Properties and Treatment. By A. K. Huntingdon and W. G. McMillan. (Longmans.) 7s. 6d.
Metallurgy. By E. L. Rhead. (Longmans.) 3s. 6d.
The Management of Steel. By G. Ede. (Spon.) 5s.
A Text-book of Assaying. By J. J. Beringer. (Griffin.) 10s. 6d.
A Treatise on Electro-Metallurgy. By W. G. McMillan and W. R. Cooper. (Griffin.) 12s. 6d.
Electric Smelting and Refining. By Dr. W. Borchers. (Griffin.) 21s. net.
Experimental Researches with the Electric Furnace. By H. Moissan. (Arnold.) 10s. 6d. net.
Steel, Its Selection, Annealing, Hardening, and Tempering. By E. R. Markham. (Spon.) 10s. 6d.
Liquid Steel, Its Manufacture and Cost. By D. Carnegie. (Longmans.) 25s. net.
The Heat Treatment of Tool Steel. By H. Brearley. (Longmans.) 10s. 6d. net.
Steel Works Analysis. By J. O. Arnold and F. Ibbotson. (Whittaker.) 10s. 6d. net.
The Technology of Iron and Enamelling and Tinning. By J. Grünwald. (Griffin.) 6s. net.
Rustless Coatings, Corrosion, and Electrolysis of Iron and Steel. By M. P. Wood. (Chapman & Hall.) 17s. net.
The Cyanide Process of Gold Extraction. By J. Park. (Griffin.) 8s. 6d. net.
Metallurgy of Gold. By T. K. Rose. (Griffin.) 21s.
Metallurgy of Lead. By H. F. Collins. (Griffin.) 21s.

MINING

Prospecting for Minerals. By S. Herbert Cox. Griffin.) 5s.
Ore and Stone Mining. By Sir C. Le Neve Foster. (Griffin.) 28s. net.
Coal Mining. By Herbert William Hughes. (Griffin.) 24s.
Mine Surveying. By Bennett H. Brough. (Griffin.) 6s. net.
Getting Gold. By J. C. F. Johnson. (Griffin.) 3s. 6d.
Mine Accounts and Mine Bookkeeping. By James Gunson Lawn. (Griffin.) 10s. 6d.
British Mining. By R. Hunt. (Lockwood.) 42s.
Colliery Working and Management. (Lockwood.) 15s.
Rock Blasting. By Z. W. Daw. (Spon.) 15s. net.
Mining Geology. By Prof. James Park. (Griffin.) 6s.
Modern Practice in Mining. By R. A. S. Redmayne. 4 vols. (Longmans.) Vol. I., 6s. net. Vol. II., 7s. 6d., net. Vol. III., 6s. 6d. net. Vol. IV., 6s.
Mining. By Arnold Lupton. (Longmans.) 9s. net.
Colliery Working and Management. By Bulman and Redmayne. (Lockwood.) 5s.
Practical Coal Mining. By T. H. Cockin. (Lockwood.) 4s. 6d.
Coal Mining. By J. Tonge. (Macmillan.) 3s. 6d.
Ventilation of Mines. By Robt. Wabner. (Scott, Greenwood.) 10s. 6d. net.
Coal, and the Prevention of Explosions and Fires in Mines. By J. Harger. (Longmans.) 3s. 6d. net.
A Practical Treatise on Mine Surveying. By Arnold Lupton. (Longmans.) 12s. net.
Elementary Chemistry for Coal-mining Students. By L. T. O'Shea. (Longmans.) 6s. net.
Elements of Mining and Quarrying. By Sir C. Le Neve Foster. (Griffin.) 7s. 6d. net.
Mining Law of the British Empire. By Charles J. Alford. (Griffin.) 8s. 6d. net.
A Text-book of Coal Mining. By Herbert William Hughes. (Griffin.) 24s. net.
Practical Coal-Mining. By George L. Kerr. (Griffin.) 12s. 6d. net.
Electricity in Mining. By Siemens Bros. (Griffin.) 10s. 6d. net.
Electrical Practice in Collieries. By Prof. D. Burns. (Griffin.) 7s. 6d. net.
The Miner's Guide to the Law Relating to Coal Mines By Atherley Jones, K.C., and Hugh Bellot. (Methuen.) 3s, 6d.

CLOCKS AND TIME

Clock-jobber's Handy Book: A Manual on Cleaning, Repairing, and Adjusting. Illustrated. (Lockwood.) 1s.
Horology in Theory and Practice. Translated from the French. Many illustrations. (Crosby, Lockwood.) 42s.
The Watch and Clock Maker's Handbook, Dictionary, and Guide. By F. J. Britten. Illustrated. (Spon.) 5s. net.
The Springing and Adjusting of Watches. By F. J. Britten. Illustrated. (Spon.) 3s. net.
Time and Clocks. By H. H. Cunynghame. (Constable.) 2s. 6d. net.

OIL AND PETROLEUM

A Treatise on Petroleum. By Sir Boverton Redwood. (Griffin.) 50s. net.
Oil Fuel: Its Supply, Composition, and Application. By Ed. Butler. (Griffin.) 7s. 6d. net.
Conquest of Oil. By F. A. Talbot. (Heinemann.) 6s.
A Handbook of Petroleum. By Capt. J. H. Thomson and Sir Boverton Redwood. (Griffin.) 8s. 6d.

MATHEMATICS

John Napier and the Invention of Logarithms, 1614. By E. W. Hobson. (Combridge Univ. Press.) 1s. 6d. net.
Introduction to Mathematics. By A. N. Whitehead. (Williams & Norgate.) 1s.
Treatise on Algebra. By Charles Smith. (Macmillan.) 7s. 6d.
Higher Algebra. By Hall and Knight. (Macmillan.) 7s. 6d.
School Geometry. By Hall and Stevens. (Macmillan.) 4s. 6d.
Plane Trigonometry. By Todhunter and Hogg. (Macmillan.) 5s.
Geometrical Conics. By Charles Smith. (Macmillan.) 6s.
Conic Sections. By Chas. Smith. (Macmillan.) 7s. 6d.
Differential Calculus for Beginners. By Joseph Edwards. (Macmillan.) 4s. 6d.
Integral Calculus for Beginners. By Joseph Edwards. (Macmillan.) 4s. 6d.

Nearly all these books, unless otherwise indicated, are readily available. The few out-of-print books included can be had from libraries.

The prices given are the maximum prices. On many books there will be a discount of 25 per cent., though this is not always stated.

Nearly all shilling books, and most technical books, are published net.

The subjects are grouped, generally, on the lines of the scheme of the Self-Educator.

Where the title and author only are given, the work is easily obtainable in various editions.

SHORT DICTIONARIES

DRAWING

ANTIQUARIAN—A drawing-paper 52 in. long by 31 in. wide.
Arrow Head—Crows' feet [*q.v.*].
Atlas—A drawing-paper 34 in. long by 26 in. wide.

BATTER—A set square having its angle other than 30°, 45°, or 60°.
Beam Compasses—Trammels [*q.v.*].
Bisecting Compasses—Wholes and halves [*q.v.*].
Black Line Process—Ferro-gallic process [*q.v.*].
Blue Print—Ferro-prussiate process.
Bordering Pen—Special drawing-pen for borders.
Bow Compass—Medium-size compasses.

CABINET NEST—A nest of superimposed palettes fitting into each other.
Calculating Rule—Slide rule [*q.v.*].
Cartridge Paper—A strong, cheap drawing-paper.
Centre Line—A line drawn through the centre of a piece of work; used as a basis for measurements.
Centrolinead—An instrument used for drawing lines to inaccessible vanishing-points.
Chinese Ink or Indian Ink—Used for inking in drawings and tracings.
Chinese White—Used for marking white lines on blue prints, etc.
Chords, Scale of—A means by which an angle can be laid off by taking compass measurements from the scale.
Columbier—A drawing-paper 34 in. long by 23 in. wide.
Compasses—Instruments used for describing circles.
Compass Scale—A short metallic scale let into a T-square or scale, for taking measurements by compass.
Continuous Paper—Paper supplied in roll instead of cut standard sheets.
Copier—An electric copier [*q.v.*].
Copying Frame—A frame in which tracings are copied or photographed.
Crows' Feet—Angular lines < > used to indicate the limit of a dimension line.
Cursor—The metallic slider upon a slide rule.
Curves—Railway curves [*q.v.*], French curves [*q.v.*].

DATUM LINE—The horizontal base line from which heights and depths are measured.
Demy—A drawing-paper 20 in. long by 15 in. wide.
Detail Drawing—A drawing which fully delineates one or more portions of a machine.
Dimension Line—A line which indicates the extent of a dimension.
Dividers—A form of compass with plain points, used for dividing a line into a number of equal parts.
Dotting Pen—A drawing-pen with a device to produce a dotted line automatically.
Double Elephant—A drawing-paper 40 in. long by 27 in. wide.

ELECTRIC COPIER—Machine for producing phototypes by electric light.
Elevation—A drawing of an object projected on to a vertical plane by means of projectors drawn perpendicular to the vertical plane from each point of the object.
Emperor—A drawing-paper 72 in. long by 48 in. wide.
Engine Divided—The marking of a scale or rule by a machine or engine.

FERRO-GALLIC PROCESS—A phototype process producing black lines on white ground.
Ferro-prussiate Process—A phototype process producing white lines on blue ground.
Flexible Curves—Strips of steel or other suitable material with attachments at intervals for deflecting and holding to any desired curve.
French Curves—Fancy curves of varying radii.

GENERAL DRAWING—A drawing which shows a machine entire.
Graphic Method—A method of determining a factor or a dimension by drawing instead of by calculation.

HAIR DIVIDER—A fine screw adjustment fitted to the leg of dividers to obtain exact measurements.
Horn Centre—A small piece of horn upon which to pivot a compass leg in order to avoid piercing the paper.

IMPERIAL—A drawing-paper 30 in. long by 22 in. wide.
Irregular Curves—French curves [*q.v.*].

KNIFE KEY—A steel implement which combines screwdriver, penknife, file, etc., for adjusting instruments, sharpening pencils, etc.

LENGTHENING BAR—An extension bar used with large compasses to increase their radius.

MEDIUM—A drawing-paper 22 in. long by 17 in. wide.
Metre Scales—Used for making drawings to metrical dimensions.
Mounted Paper—A paper mounted upon linen to give it strength and durability.

NAPIER COMPASSES—A folding compass for the pocket.
Needle Point—A compass point consisting of an ordinary needle held in place by a screw, and consequently easily renewable.

ODONTOGRAPH—A combination scale used to facilitate the marking out of wheel teeth.
Oxgall—Used occasionally with inks and colours to make them work freely.

PALETTES—Ware receptacles for mixing colours.
Paper—"Hot-pressed" has a very smooth surface; "Not" has a medium surface; and "Rough" has a coarse surface.
Paper Scales—Scales engraved upon stout paper or Bristol board, convenient for measuring curves
Parallel Rule—A straightedge or rule fitted with parallel joints or milled rollers to facilitate the drawing of parallel lines.
Photoprint or Phototype—A copy of a tracing produced by the action of light upon a sensitised paper.
Pillar Compasses—Folding compasses for the pocket, forming a set of instruments.
Plan—A drawing of an object projected on to a *horizontal* plane by means of projectors drawn perpendicular to the horizontal plane from each point of the object.
Planimeter—An instrument used for computing areas.
Pricker—An implement with a needle point; used for pricking through centres and curved outlines where the paper is too opaque for tracing.
Printing Frame—A glazed frame used for phototype printing.
Proportional Compasses—Double-ended dividers with adjustable fulcrum, used for reproducing dimensions at any predetermined proportion.
Protractor—A scale, usually circular, which has the degrees of a circle marked thereon.

RAILWAY CURVES—Regular curves usually made in sets, and varying from 1½ in. to 240 in. radius.
Retree Paper—Slightly defective sheets of paper.
Royal—A drawing-paper 24 in. long and 19 in. wide.

SECTION—A view of an object cut through in order to show its construction and interior.
Sectional Colours—Various colours recognised as representing various metals and materials.
Sectional Elevation and Sectional Plan—See page 3412.
Sectional Paper—Paper ruled in squares to scale either English or metrical measures; useful for sketching to scale, plotting of curves, etc.
Sector—An instrument constructed like a hinged ruler, and having various lines and divisions on it, by which other lines can be divided into any number of equal parts. Also used for constructing regular polygons.
Sensitised Paper—A chemically prepared paper for photoprinting.
Set Square—A sheet of vulcanite, pearwood, etc., cut to form a right angle with two of its edges, the third edge being 30°, 45°, or 60° angle.
Slide Rule—A rule with a sliding portion, engraved upon a logarithmic basis, to facilitate calculations.
Slope—A batter [*q.v.*].
Spring Bows—A small pair of compasses which maintain their full radius by reason of their spring formation; the radius is reduced by drawing the legs together by a screw.
Standards—Regular proportions of machine details which are tabulated for reference.
Stencils—Used for numbering drawings, corners for borders, etc.
Straightedge—A flat strip of wood with an accurately finished edge for drawing straight lines.
Stress Diagram—A diagram drawn so as to represent stresses graphically.
Sun Copy—A phototype [*q.v.*] printed by daylight.
Super Royal—A drawing-paper 27 in. long by 19 in. wide.

TAPE—A continuous band of linen or steel coiled in a leather case, and engraved in feet and inches, etc., usually either 33 yds. or 66 yds. long.
Template—A piece of paper or cardboard cut to the exact outline of an object, to facilitate manufacture.
Tracing—A reproduction of a drawing on a transparent paper or linen.
Tracing Frame—A frame holding a sheet of glass, used to trace old drawings and prints which are best seen through the tracing paper when the light strikes from beneath.
Tracing Linen or Cloth—A prepared transparent linen for tracings.
Tracing Paper—A prepared transparent paper for tracing.
Trammels—A straight bar upon which slide movable heads carrying pen or pencil points, for striking large radii.
Triangular Scale—A scale of triangular section having six working edges and a great number of scales.
T-square—A piece of mahogany or pear-wood with a headpiece in the form of a **T**, used for producing parallel lines, and as a base for set-squares.

UNIVERSAL SCALE—A scale upon which all ordinary scales are marked in parallel rows.

VERNIER—A short scale made to slide along a graduated instrument, for measuring very small intervals.

WHEEL PEN—A drawing-pen with wheels for dotted work.
Wholes and Halves—Compasses fixed at the proportion of one to two.

PHYSIOLOGY

SEE ALSO BIOLOGY AND BACTERIOLOGY

ACETABULUM — The socket in hip joint into which thigh-bone head fits.
Afferent nerve—A nerve which carries an impulse to the brain.
Afferent vessel — Carries blood to lungs or other purifying organ.
Alimentary—Pertaining to food.
Ampulla—Part of the internal ear in vertebrates.
Aorta—The main artery of the body.
Appendix—A blind tube extending from the cæcum.
Arterial—Pertaining to an artery. Pure blood.
Artery—A vessel carrying blood *from* the heart.
Articulation—A joint.
Assimilation—The process of converting digested food into body tissue.
Auricle—A cavity in the heart.

BICEPS—The muscle which bends the fore-arm.
Bicuspid—The first two grinding teeth in each jaw.
Bile—The secretion of the liver.
Bile-duct—Tube leading from liver to intestine which carries the bile.

CÆCUM—A blind tube in intestines.
Calcaneum—The heel-bone.
Canine — The eye-teeth, outside the incisors.
Capillaries—Microscopic blood-vessels having very thin walls.
Cardiac—Pertaining to heart.
Carotid—The main artery carrying blood to the head.
Carpal—Pertaining to the wrist.
Carpus—The bones of the wrist.
Cartilage—Gristle; the covering of the ends of many bones.
Caval veins—The large veins which carry impure blood to the heart.
Centrum—The body of a vertebra.
Cephalic—Pertaining to the head.
Circulatory organs—The structures which convey blood and lymph.
Coagulation—The process of clotting in blood.
Cochlea—A bony part of internal ear.
Columnar epithelium — Epithelium made of elongated cells placed at right angles to the surface.
Condyle — A bony projection which helps to form a joint.
Connective tissue—That which binds or connects tissues together.
Contractile — Having contracting power.
Cornea—The membrane in fore part of eye through which light passes.
Corpuscles—Microscopic cells in blood or lymph.
Cortex—The outer layer of brain.
Costal—Pertaining to the ribs.
Cranial nerves—Nerves which arise from the brain.
Cranium—The brain-case or skull.

DENTINE—The hard part of teeth.
Dermis—The inner layer of skin.
Diaphragm — The muscle separating the chest from the belly.
Dorsal—Pertaining to the back.
Duct—A tube, generally carrying the secretion of a gland.
EFFERENT NERVES—Nerves transmitting impulses from the brain.
Efferent vessels—Vessels which carry pure blood from the lungs.
Embryology—Science of development.
Epidermis—The outer protective layer of skin.
Epiglottis—An elastic structure which prevents food entering air-passages.
Epithelium—Cells which cover surfaces on or in the body.
Excretion—The processes by which waste matters are expelled.
Extensor—A muscle which straightens or extends a limb.

FEMORAL—Pertaining to thigh.
Femur—The thigh bone.
Fibula—The smaller bone on the outer side of the lower leg.
Flexor—A limb-bending muscle.
Foramen—A hole in a bone through which a vessel or nerve passes.

GALL—Bile.
Gall-bladder—The bag in which the bile is stored.
Ganglion—Collection of nerve-cells.
Gastric—Relating to the stomach.
Gastric juice—The digestive fluid of the stomach.
Glenoid cavity—Socket into which head of upper arm bone fits.
Glottis—The opening into windpipe.
Grey matter—The cellular part of the nervous system.

HÆMOGLOBIN—The colouring matter of blood, which carries oxygen.
Hepatic—Pertaining to the liver.
Humerus—The upper arm bone.

INSERTION—The end of a muscle attached to a movable part.
Intercostal—Between the ribs.
Iris—The coloured part of eye.

LACTEALS—Lymphatic vessels of the intestine.
Larynx—The voice-box.
Ligament—A strong fibrous band connecting two bones.
Lymph—A clear colourless fluid containing corpuscles.
Lymphatic gland—A swelling on a lymphatic vessel.

MAXILLA—A bone of the jaw.
Membranous labyrinth—Part of internal ear.
Mesentery—A membrane which holds the intestines in position.
Metabolism — The chemical changes which take place in the body.
Metacarpus—The bones of the palm.
Metatarsus—The bones of the instep.
Mitral—Valves on the left side of the heart, between auricle and ventricle.
Molar—A permanent cheek tooth.
Mucous membrane—A soft membrane lining a tube.

NERVE-CELL—The essential part of a nerve unit.
Nerve-fibre — The thread extending from a nerve cell.
Neural—Pertaining to the nerves.
Neuron—A nerve cell and its prolongations.
Nuchal—Pertaining to nape of neck.

ŒSOPHAGUS—The gullet.
Oral—Pertaining to the mouth.
Orbit—Cavity containing eyeball.
Origin—The end of a muscle attached to a fixed part.
Osmosis—The process by which fluids or substances pass through a membrane.
Ossicle—A little bone.
Ovary—The female sexual organ containing eggs.
Ovum—An egg cell.

PANCREAS—The sweet-bread, a gland in the abdomen.
Papilla—A little projection.
Parotid—A gland producing saliva.
Patella—The knee-cap.
Pelvis—The bones to which the hind or lower limbs are joined.
Pepsin—A digestive ferment in gastric juice.
Peptone—A soluble substance produced in digestion.
Pericardium—The membrane in which the heart lies.
Peristaltic—The movements of the intestine.
Phagocyte—A colourless corpuscle.
Phalanges—The finger and toe bones.
Pharynx—Cavity at back of mouth.
Physiology—Science of function.
Portal—Pertaining to the vessels which carry blood to the liver.
Pulmonary—Pertaining to lungs.
Pyloric—The end of the stomach nearest the intestine.

RADIUS—The bone of the forearm on the side of the thumb.
Retina—The internal coat of eye.
Rouleaux—Little rolls or chains of blood corpuscles.

SALIVARY—Glands producing saliva.
Scapula—The shoulder-blade.
Sclerotic—The external hard coat of the eye.
Sebaceous gland—A gland producing an oily secretion.
Segmentation—The early divisions of a germ cell.
Semilunar—The name of three valves at the beginning of the pulmonary artery and the aorta.
Sensation—A state of consciousness.
Serum—The colourless fluid element of the blood.
Spinal cord—The mass of nerve tissue with the spinal column.
Spleen—A large gland in the abdomen.
Stationary air—Air which remains still in the lungs in breathing.
Sternum—The breast-bone.
Sympathetic nervous system—Part of the nervous system regulating blood supply and other functions.
Synovia—The fluid which lubricates the joints.
Synovial—That which secretes synovia, *e.g.* the synovial membranes.

TARSUS—The bones of the ankle.
Tendon—The strong fibrous band which attaches a muscle to a bone.
Thoracic duct—Tube which receives lymph and opens into the great neck veins.
Thorax—The chest.
Thymus—A ductless gland near heart.
Thyroid—A ductless gland in neck.
Tibia—The shin-bone.
Tidal air—Air taken in at an ordinary breath.
Trachea—The windpipe.
Tricuspid—Valves on right side of heart, between auricle and ventricle.
Tympanum—The drum of the ear.

ULNA—The bone of the forearm on the little-finger side.
Ureter—The tube which carries urine from the kidney.

VALVE—A flap in a vessel or tube preventing backward flow of fluid.
Vein—A vessel carrying blood towards the heart.
Venous—Pertaining to a vein. Impure blood.
Ventricle—The thick-walled chambers of the heart which by contracting force blood into the arteries.
Vertebra—A bone of the backbone.
Viscera—The internal organs.
Vocal chords—Two thin folds of elastic tissue in the larynx.
WHITE MATTER—The nerve fibres of the nervous system.

ACIDIMETRY—The determination of the amount of acid in a substance.

Albumens or **Albumins**—A group of proteins soluble in water. Egg albumin (white of egg) is an example.

Albuminoids—Organic carbon compounds containing hydrogen, oxygen, nitrogen, and sometimes sulphur, and of very complex nature. They are essential both to animal and plant life.

Albuminoid Ammonia (in water)—Ammonia obtained by distillation with alkaline permanganate by Wanklyn's method.

Alcohol—Generally understood to mean ethyl alcohol, C_2H_5OH, a constituent of alcoholic beverages, and obtained by the fermentation of sugar. The term is also applied to substances of similar composition.

Aldehydes—Substances obtained by the careful oxidation of alcohol.

Alizarine—One of the colouring matters of madder (*Rubia tinctoria*), the other being purpurin. Also prepared artificially from coal-tar.

Alkalimetry—The determination of the amount of alkali in a substance.

Alkaloids—Bases obtained from plants and possessing highly poisonous or medical properties.

Alloy—An intimate mixture (possibly containing compounds) of metals with one another.

Alum—A double sulphate of alumina and another metal, crystallising in the regular system with 24 molecules of water. The name is often applied in commerce to sulphate of alumina alone.

Amalgam—An alloy of mercury with another metal or metals.

Amorphous — Without crystalline structure.

Aniline—A colourless oil obtained indirectly from coal-tar and belonging to the class of primary amines.

Aniline Dyes—Dyes obtained from aniline. The term is often incorrectly applied to all coal-tar dyes.

Animal Charcoal or **Bone Black**—A substance obtained by carbonising bones.

Animal Oil or **Bone Oil** — An oil obtained by distilling bones.

Anthracene—A white crystalline solid from coal-tar and the mother substance of the alizarine dyes.

Antichlor—Sulphites and other substances added to destroy any residues of chloride of lime left in a fibrous material after bleaching.

Antifebrin—Acetanilide; an antipyretic.

Antipyretic—Medicinal substance to allay fever.

Antipyrine—Phenyl-dimethyl pyrazolone; an antipyretic.

Apatite—A mineral phosphate and fluoride of calcium.

Aqua-fortis—Nitric acid.

Aqua-regia—A mixture of one part nitric acid and four parts hydrochloric acid.

Argol—Crude bitartrate of potassium.

Asbestos—A fibrous mineral substance used in making fireproof articles.

Ash—Calx or mineral matter left on burning organic substances.

Asphalt—A natural mineral bituminous substance.

Aspirator—A machine to draw a current of air or other gas through an apparatus.

Assay—The determination of the quantity of a constituent contained in a substance.

-Ate—The termination of the names applied to salts of acids containing oxygen.

Autoclave—A digester or closed vessel in which liquids can be heated above their boiling points.

Azo—The group $N=N$ characteristic of a large number of colouring matters derived from coal tar.

BALSAMS—The exudations of plants consisting of resins, volatile oils, aromatic acids, and other substances.

Base—A metallic oxide or organic radical having the power of combining with an acid.

Basic—Having the properties of a base.

Bauxite—A naturally occurring hydrated oxide of alumina.

Beaker—A tumbler-shaped vessel of thin glass.

Benzaldehyde—Oil of bitter almonds: C_6H_5CHO.

Benzene—A liquid volatile hydrocarbon (formula C_6H_6) contained in coal-tar.

Bittern—The mother liquid that remains after common salt has crystallised out from sea-water.

Blacklead—Plumbago or graphite; a form of carbon.

Bleach or **Bleaching Powder**—Chloride of lime or calcium hypochlorite.

Blue-stone—Sulphate of copper.

Boiled Oil—Linseed oil which has been heated in air with litharge, manganese borate, or other substances, so that it has become thick and viscous.

Boiling-point—The temperature at which a liquid boils, the pressure being that of a normal atmosphere unless otherwise stated.

British Gum—*Dextrin.*

Bunsen Burner—Gas-burner having holes at the bottom for the admission of air.

Burette—A graduated glass tube provided with a stop-cock at the bottom for measuring fluids.

CALCINATION—The operation of ignition or heating till nothing but a mineral residue or calx remains.

Calc-spar—Native crystalline calcium carbonate.

Calibration—The process of ascertaining whether a vessel or other measuring apparatus holds or delivers the exact volume marked upon it.

Caliche—Impure native nitrate of soda or Chili saltpetre.

Calomel—Mercurous chloride.

Calorie—Metrical unit of heat, being the amount of heat required to raise one gramme of water 1° C.

Calorimeter—Apparatus for measuring heat, usually the amount of heat developed by substances when burnt.

Caramel—Brown colouring matter obtained by heating sugar or glucose.

Carbide—A compound of a metal with carbon—as calcium carbide.

Carbohydrate—A compound of carbon, hydrogen, and oxygen, the relative proportions of the two latter elements being the same as in water—as sugar.

Carbolic Acid—Phenol: C_6H_5OH. A constituent of coal-tar.

Carbonyl—The group CO—that is, a group composed of a carbon and oxygen atom in combination.

Carborundum—An extremely hard substance containing carbon and silicon.

Catalysis—The effect by which two substances are enabled to react in virtue of the presence of a small quantity of a third substance termed a *catalytic agent.*

Contact Action—A synonym for catalytic action. See *catalysis.*

Centinormal — One-hundredth of normal strength.

Chamber Acid—The crude sulphuric acid which collects on floors of the lead chambers; of a strength not usually exceeding 70 per cent. of pure acid.

Chili Saltpetre—Sodium nitrate.

China Clay—Kaolin, the purest variety of clay.

Chloride of Lime—Bleaching powder or calcium hypochlorite.

Cinnabar—Native sulphide of mercury or vermilion.

Cochineal—The body of a female insect which produces red dye-stuff.

Collodion—A solution of soluble nitrocellulose in a mixture of alcohol and ether.

Colloid—A substance in the amorphous non-crystalline state — as India-rubber, glue, cellulose.

Colophony—See *rosin.*

Commercial Chemicals — Such as have not been specially purified.

Compound—A substance composed of two or more elements in combination with one another.

Condenser—Apparatus for condensing a vapour to a liquid, consisting commonly of a tube surrounded by a jacket of cold water,

Constitution—The mode in which elements are combined with one another in a compound.

Corundum—Native alumina or oxide of aluminium of the same composition as sapphire and ruby.

Creosote—Substance obtained by distilling wood or coal-tar.

Crucible—Cup-shaped vessel of fire-resisting material in which substances can be strongly heated.

Crude Product—Unpurified material obtained in chemical manufacture or laboratory work.

Cryolite—A native fluoride of aluminium and sodium.

Crystals—Characteristic geometrical shapes bounded by plane surfaces in which most solid substances occur, especially when separated from solution or on solidification.

Crystalline Systems—The six classes into which all known crystalline shapes are grouped.

DEAD OILS—The name applied to that portion of the coal-tar distillate which sinks in water.

Decantation—The process of pouring off the clear liquid after the solid matter has settled to the bottom.

Decinormal—One-tenth of normal strength.

Deliquescence—The absorption by a substance of moisture from the air, at times in sufficient quantities to cause it to liquefy.

Density—The mass of a unit volume of a substance. See also *specific gravity.*

Dephlegmator—A type of reverse condenser chiefly used in distilleries for freeing alcohol from water.

Desiccation—The process of drying.

Desiccator—As used in analytical work, a glass vessel with ground closely-fitting lid containing a hygroscopic substance such as calcium chloride, strong sulphuric acid or phosphorus pentoxide, so that any body placed inside rapidly loses its moisture and dries.

Dextrin—A gummy substance obtained from starch by the action of diastase.

Dextro-rotatory—Rotating the plane of polarisation of light to the right.

Dextrose—Grape sugar, a six-carbon sugar obtained from starch.

Diamines—Diamido compounds: compounds containing two amido (NH_2) groups or their derivatives.

Diastase—An unformed or soluble ferment which converts starch into sugar.

Digester—See *autoclave.*

Digesting—The process of heating together a solid and a liquid so as to give them every opportunity of reacting with one another.

Distillate—That portion which passes into vapour and collects in the receiver when a substance is distilled.

EFFLORESCENCE—Formation of a powdery deposit on crystals through loss of water or of a powdery crystalline deposit on the surface of a porous body, as in the case of nitre on the surface of the earth in India.

Electrolysis—Separation of a chemical substance into its constituents by an electric current.

Elementary Analysis—The determination of the proportions in which the elements are contained in a substance.

Elutriation—Washing a finely powdered substance, such as clay, by repeated treatment with fresh water.

Endothermic Compounds — Compounds in the formation of which heat is absorbed.

Enzyme—Unorganised ferment.

Equivalent Weights—Weights of substances which will combine with or replace one part of hydrogen. The equivalent weight of a compound will be a simple fraction, usually one-half, of the molecular weight.

Ester—An ethereal salt.

Ether—Usually understood to mean ethyl ether. A highly volatile and inflammable organic liquid ($(C_2H_5)_2O$). The term is also applied to all substances of similar composition, and even to esters or ethereal salts.

Ethereal—Pertaining to ether; thus by an *ethereal* solution is meant a solution in ether.

Ethereal Salts—A salt of an acid in which the hydrogen is replaced by ethyl (C_2H_5) or other radicals, just as a metal replaces the hydrogen of an acid to form metallic salts.

Eudiometer—A gas analysis apparatus.

Excess—A reagent is present in excess when more than sufficient has been added to react with the portion of a substance under examination.

Exothermic Compounds — Compounds in the formation of which heat is developed.

Extraction—Removal of one constituent from a mixture of substances by means of a solvent in which the remaining constituents do not dissolve.

FAT—Natural product composed of ethereal salts, such as glyceryl, stearate, palmitate, and oleate.

Fatty Acids—Acids formed on the saponification of fats. The generic term is now applied to several series of organic acids, including acetic and formic acids.

Fehling Solution—Solution of copper sulphate with Rochelle salt and caustic soda; used in testing for sugars.

Ferment—A nitrogenous organic substance with or without organised structure and power of reproduction.

Fermentation — Chemical process brought about by ferments.

Ferric or Ferri Salts—Salts of iron containing the trivalent iron atom.

Ferrous or Ferro Salts—Salts of iron containing the divalent atom.

Filtrate—The clear liquid obtained by filtration.

Filtration—The separation of a solid from a liquid by passage through a porous medium.

Flask—A globular-shaped vessel of thin glass.

Fluxing—Melting or fusing.

Foots—The deposit of impurities formed in the process of clarifying oils.

Forchammer Process—Determination of amount of acidified permanganate required to oxidise organic matter in a sample of water (water analysis).

Fraction—A portion of a distillate which has passed over during a definite range of temperature.

Free Acid—An acid not in combination with a base.

Free Ammonia (in water)—Ammonia, probably in combination as a salt, sometimes termed *saline ammonia*, and obtained by distilling the water with sodium carbonate.

Free Base—A base not in combination with an acid.

French Chalk—Steatite or soapstone. A hydrated magnesium silicate.

Fusel Oil—Fermentation amyl alcohol formed in small quantities during alcoholic fermentation.

Fusion Mixture—A mixture of equal parts of sodium and potassium carbonates, which fuses at a lower temperature than either separately.

GAS LIQUOR—An aqueous liquor rich in ammonium salts obtained in the purification of coal gas.

Glauber's Salt—Sodium sulphate.

Glucose—See *dextrose*.

Glucosides—Naturally occurring vegetable substances which split up on hydrolysis, yielding glucose and another substance which is not a carbohydrate.

Gluten—A sticky, nitrogenous substance obtained by washing out the starch from wheat flour.

Glycerine or **Glycerol**—An oily liquid with a sweet taste, in reality an alcohol obtained by the saponification of natural fats and oils.

Gooch Crucible—One with a perforated bottom on which is a layer of asbestos so that the precipitate may be filtered, washed, and dried.

Grape Sugar—See *dextrose*.

Graphite—Blacklead; a form of carbon.

Gum—An amorphous carbohydrate characterised by its sticky properties and obtained from the natural exudations of plants.

Gun-cotton—Nitrocellulose obtained by treating cotton with a mixture of strong nitric and sulphuric acids.

Gypsum—Native crystalline calcium sulphate.

HALOGEN—One of the following four elements—chlorine, bromine, iodine, or fluorine.

Hardness of Water — The soap-destroying powder due to dissolved salts.

Homologues—Organic compounds of analogous composition to one another—for instance, methane, ethane, and propane are homologues.

Hydrate—A chemical substance having water in combination with it.

Hydrocarbon—A compound of carbon and hydrogen.

Hydrolysis—A type of chemical decomposition brought about by various agencies, but always accompanied by absorption of water.

Hydroxide—A compound consisting of a metal or radical in combination with hydroxyl groups—for instance, copper hydroxide $Cu(OH)_2$, alcohol or ethyl hydroxide $C_2H_5(OH)$.

Hydroxyl—The group (OH).

Hygroscopic Substance—One which absorbs moisture from the atmosphere.

Hypo—A prefix denoting a smaller proportion of oxygen.

INDICATOR—Substance used to indicate the completion of a reaction in titration processes — for instance, methyl orange.

Infusion—A liquid obtained by treating a vegetable substance with a solvent to dissolve out some of its constituents.

Inorganic Compounds—All compounds excepting those of carbon.

Isomeric Substances—Those having the same percentage composition, but different properties.

Isomerism—The phenomena exhibited by isomeric compounds.

-Ite—The terminal ending of names applied to salts of acids containing less oxygen than those ending in *-ate*.

KELP—The ash of certain seaweeds used as a source of iodine.

Kieselguhr—A porous silicious substance, with absorbent properties.

Kjeldahl Estimation—A method of determining nitrogen, especially in organic substances.

LACTIC ACID—An acid formed in the souring of milk by the action of a ferment on the milk sugar.

Lactose—See *milk sugar*.

Lævo-rotatory—Rotating the plane of polarisation of light to the left.

Lamina—A thin sheet or plate.

Laughing Gas—Nitrous oxide.

Leblanc Process—A method of making washing soda from common salt.

Lees—The deposit at the bottom of a vessel in which wine is fermented.

Lime—Calcium oxide obtained by burning limestone or calcium carbonate.

Liquation—The separation of bodies by heating and allowing the more fusible to melt and flow away.

Liquor—A general term applied to liquids containing dissolved matter.

Litharge—Lead oxide, PbO.

Litmus—A colouring matter obtained from a lichen and used as an indicator.

Logwood—The wood of a tree, which yields a red dye.

Lye—An alkaline liquor containing the caustic alkaloids or their carbonates.

MALTOSE, or **MALT SUGAR** — A sugar produced by the action of diastase on starch.

Marsh Gas—Methane (CH_4); the firedamp of the miners.

Marsh's Test—A test for arsenic.

Measuring Flask—A flask which, filled to a mark on the neck, contains a measured volume of liquid.

Melt—A fused mass of crude product obtained by heating.

Mercuric Salts—Compounds of the higher oxide of mercury (HgO).

Mercurous Salts—Compounds of the lower oxide of mercury (Hg_2O).

Meta—A prefix used to distinguish one isomer from another.

Metal—An element which will combine with oxygen to form a base.

Methane—See *marsh gas*.

Methyl Orange—The sodium salt of an aniline dye; used as an indicator for strong acids.

Microcosmic Salt—Hydrogen sodium ammonium phosphate $HNa(NH_4)PO_4$.

Milk Sugar—A sugar found in milk.

Millon's Reagent—A solution of mercuric nitrate containing nitric acid.

Mineral Acid—This term usually includes sulphuric, hydrochloric, nitric, and other acids of inorganic origin.

Minium—See *red lead*.

Molecule—A word meaning little mass; the smallest particle of gaseous matter that can exist by itself.

Mordant—A substance used in dyeing to aid in fixing the dye on to the fibre.

Must—A crude liquor expressed from fruit.

NATIVE—Occurring in a natural state.

Nessler's Solution—A solution of mercuric iodide in potassium iodide, prepared according to a special recipe. It gives a yellow-brown colour, with even minute traces of ammonia, and a precipitate with larger quantities.

Nitre—Potassium nitrate.

Nitro-cellulose—Nitric esters of cellulose, such as gun-cotton.
Nitro-compound—One containing the nitro group (NO_2).
Nitrometer—A form of gas analysis apparatus used in the estimation of nitrous oxide in vitriol.
Nordhausen Sulphuric Acid—The fuming acid $H_2SO_4.SO_3$.
Normal Acids and Alkalies—Solutions containing an equivalent weight in grammes of the substance in question dissolved in one litre of water at 15° C.,
Normal Solutions — Solutions of standard strength based on a sytem of chemical equivalence.

OLEFINS—A group of hydrocarbons of general formula C_nH_{2n}, where n is any integer; for example, olefiant gas.
Organic Compounds—All compounds of carbon, with the exception of the monoxide and dioxide, which are usually reckoned as inorganic compounds.
Oxidation—The process of adding oxygen or subtracting hydrogen from a substance.
Oxide—A compound of an element or radical with oxygen.
Oxidising Agent—A reagent for adding oxygen to or withdrawing hydrogen from a substance.
Ozone—A form of oxygen containing three atoms to the molecule.

PARAFFINS—A group of hydrocarbons of the general formula C_nH_{2n+2}, where n is any integer; for instance, marsh gas (CH_4).
Pearlash—Calcined potassium carbonate.
Permanent Hardness—Hardness of water not removed by boiling, and generally due to the presence of dissolved sulphates.
Permanent White — Precipitated barium sulphate.
Peroxide—An oxide containing more oxygen than the common oxide.
Phenol—Carbolic Acid (C_6H_5OH).
Phenol-phthalein—An organic synthetic dye stuff used as an indicator for weak acids.
Pickling—A term applied to the process of soaking a solid in a liquid.
Pinch-cock—A spring clip for closing a piece of indiarubber tubing.
Pipeclay Triangle—Three pieces of clay pipe-stem held with iron wire, and used for supporting crucibles.
Pipette—Graduated glass tube for measuring liquids.
Plaster of Paris—Hydrated calcium sulphate or gypsum, from which part of the water has been removed.
Plumbago—Blacklead or graphite, a form of carbon.
Potash or **Caustic Potash**—Potassium hydroxide.
Precipitant—A substance used to bring about the formation of a precipitate.
Precipitate—A solid substance formed in a solution by a chemical reaction.
Proof Spirit—An antiquated and cumbrous standard of strength for alcohol. The density of proof spirit works out to ·91984 at 60° F. It contains 49·24 per cent. of alcohol by weight.
Protein—See *Albuminoids*.
Proximate Analysis—The determination of the ingredients in a mixture.
Prussian Blue—A pigment formed of complex cyanides of iron.
Pyrites—Native sulphides of iron, and of iron and copper.
Pyrolusite—A mineral containing crude oxide of manganese.

QUALITATIVE ANALYSIS — The process of ascertaining the nature of the constituents of a substance.
Quantitative Analysis—The process of ascertaining the proportions of the constituents of a substance.
Quartz—Crystalline silicon oxide or silica (SiO_2).
Quicklime—Calcium oxide (CaO).

RADICAL or **RADICLE**—A complex group of elements playing the part of, and reacting as, a single element.
Reaction—The chemical action of one substance on another.
Reagent—A substance, generally in solution, used to bring about a characteristic chemical reaction.
Red Lead or **Minium**—The oxide of lead (Pb_3O_4).
Reducing Agent—A reagent for adding hydrogen or abstracting oxygen from a substance.
Reduction—The process of adding hydrogen or withdrawing oxygen from a substance.
Reichert's Process—The standard method for estimating volatile fatty acids in butter.
Resin or **Colophony**—A resinous substance left in the retort after the distillation of crude turpentine.
Resins—A class of vegetable solids of brittle and glass-like fracture.
Rider—A small V-shaped wire which is shifted from one position to another on the beam of a balance, instead of putting weights into the pan.
Rochelle Salt—Sodium potassium tartrate.
Rock Crystal—Quartz.
Rock Salt—Native sodium chloride or unrefined common salt.
Rouge—Finely ground ferric oxide (Fe_2O_3).

SALINE—Partaking of the nature of a salt.
Saline Ammonia (in water).—See *free ammonia*.
Salt—Generic term for the product of the combination of an acid with a base.
Salt Cake—Crude sodium sulphate; the first stage in the manufacture of soda by the Leblanc process.
Sampling—The operation of removing a small portion or sample representative of the whole.
Sand Bath—A shallow metal tray containing a layer of sand on which vessels may be heated.
Saponification—The process by which a soap (metallic salt of a fatty acid) is obtained from a fat. The term is applied also to the hydrolysis of any ethereal salt with the formation of an alcohol and a fatty acid or its salt.
Saturated Solution—A solution containing as much substance dissolved in it as the liquid will take up.
Semi-normal—One half of normal strength.
Silicious—Composed of, or partaking of the nature of, silica or sand.
Slag—A fusible silicate formed in the process of obtaining metals from their ores.
Slaked Lime—Lime slaked; that is, treated with sufficient water to form calcium hydroxide.
Smelt—Cobalt blue. A silicate of cobalt.
Soap—The metallic salt of a fatty acid, generally oleic, palmitic, or stearic, or a mixture of these.
Soda Lime—A mixture of soda and lime, used for absorbing carbon dioxide gas.
Soft Soap—A potash soap or potassium salt of a fatty acid, hard soaps being sodium salts.
Solvent—Liquids used for dissolving substances.
Soxhlet Apparatus—An automatic apparatus for the extraction of fatty substances with volatile solvents.
Specific Gravity—The ratio of the weight of a substance to the weight of an equal volume of water.
Standard Solution—Solution of definite strength, usually normal or decinormal.
Steam Oven—An oven surrounded by a steam jacket.
Still—Distilling apparatus.
Suction Gas—See *water gas*.
Sulphonic Acid—An organic acid containing the group SO_2H.
Superphosphate—A manurial substance containing monocalcium phosphate.
Synthesis—The building up of a compound from its elements, or from simpler substances.

TALC—A substance of similar composition to French chalk.
Tartar Emetic—Potassium antimony tartrate.
Temporary Hardness—Hardness of water removed by boiling, and due to bicarbonates. See also *hardness*.
Thermometric Scales—Those commonly used are the Centigrade and Fahrenheit scales.
Thio—A prefix showing that oxygen in the substance has been replaced by sulphur.
Tincal—Crude borax.
Titration—The process of adding a measured amount of a solution of one substance to another until the reaction between them is complete.
Turmeric—Yellow colouring matter.
Twaddell Degrees — A technical method of reckoning the specific gravity of a liquid. Thus, Degrees Twaddell $= \frac{\text{specific gravity} - 1{,}000}{5}$, water $= 1{,}000$

ULTIMATE ANALYSIS—The separation of substances into their constituent elements.
Ultramarine — An artificial blue colouring matter resembling ground lapis lazuli.
U-tube—Glass tube in the shape of the letter U, and used for absorbing gases.

VACUUM DESICCATOR—A desiccator from which the air can be exhausted.
Valency—The combining capacity of an element or the number of hydrogen atoms or their equivalents with which an atom of the element in question will combine.
Vermilion—Sulphide of mercury; used as a pigment.
Vitriol—Sulphuric acid.

WASH-BOTTLE — Bottle or flask with which a jet of water can be directed on to a precipitate for the purpose of washing it.
Washing — Treating a substance (usually a precipitate) with successive quantities of a solvent, such as water, in order to dissolve soluble impurities.
Water Gas—A mixture of hydrogen and carbon monoxide gases obtained by passing steam over red-hot coke.
Water Oven—*Steam oven*.
Wax—An ethereal salt of a fatty acid, and a monohydric alcohol (alcohol with a single hydroxyl group).
Weighing-bottle—A small stoppered bottle in which a substance can be weighed out of contact with the surrounding air.
Welldon's Process—A process for the recovery of manganese from still liquors, and hence indirectly a method for making chlorine.
White Arsenic or **Arsenic**—Arsenic oxide (As_2O_3).
White Lead—Basic carbonate of lead.

YEAST — A vegetable (organised) ferment which is capable of converting sugar into alcohol.

ZINC WHITE—Zinc oxide (ZnO).

CIVIL ENGINEERING

SEE ALSO MECHANICAL ENGINEERING AND MINING

ABUTMENTS—Masses of masonry or natural rock, upon which the ends of a bridge are supported.
Adit—Subterranean passage or gallery.
Air-lock—Chamber with ingress and egress doors for workmen passing into workings where water is excluded by pneumatic pressure.
Ajutage—Tube fixed at the mouth of a hydraulic vessel to regulate water discharge.
Alignment—The setting of two or more planes, or three or more poles or points, in one straight line.
Alternate Stresses—Stresses by which structures, or parts of structures, are placed alternately in tension and compression, as in counterbraced structures, subject to moving loads.
Anchor and Collar—Hinges employed in hanging lock gates.
Apron—A protection of concrete or other material to prevent the scouring effects of running water.
Ashlar—Blocks of stone cut to regular shapes, generally rectangular.
Attle—Any rubbish or stony matter.

BACK SIGHT—The first reading upon setting up a level in a new position.
Balance Box—Box which counterbalances the load lifted by a crane, usually a cast-iron box loaded with scrap iron or kentledge.
Banker—Bench or table on which masons prepare and shape their materials.
Bare—A term which signifies that a dimension is very slightly under the size preceding the term.
Barrage—The barring of a river or other watercourse to bank up the water behind.
Barring Engine—An engine used for the initial turning of larger engines.
Barrow—Receptacle for carrying earth or other material.
Bascule—A bridge lifting in two leaves hinged to the abutments.
Batter—Face of a retaining wall when built in a leaning position.
Bay—In a lattice girder, the space included between two adjacent apices is called a bay.
Beaumonteque (baum-antik) — Any mixture for stopping holes in stone or woodwork.
Benches—Platforms about 6 ft. in width on the sides of cuttings.
Benching—Is cutting steps in the sloping surface of earth before filling in behind a retaining wall.
Bench-mark—A recorded point in a survey, either marked on the ground or described in the field book or level book.
Berm—Narrow strip of level ground along the face of a slope.
Betty—An iron rod used as a crowbar.
Bight—The hanging loop of a chain or rope which falls below the pulleys in lifting tackle.
Block and Fall—The rope tackle used in lifting heavy loads.
Bollard—Post of cast iron or timber, to which vessels are moored.
Bolster—Short piece of wood interposed horizontally between head of post and supported beam.
Boning Staff—Upright rod with a cross bar at right angles; used for adjusting intermediate points of levels and gradients.
Bonnet—Hole formed in iron pipes and fitted with lid.
Boom—A term applied to the mast or girder of a derrick crane, and the flanges of a large girder.
Booms—Pieces of timber connected with fender piles to protect cofferdams.
Bowstring Girder—A girder in which the outward or horizontal thrust of a curved beam is sustained by a horizontal tie beam forming the chord of an arc.
Braces—Diagonal pieces used in the centre portion of a truss.
Break Up—Excavation begun from an underground passage or gallery and carried upwards.
Breast-wall—A wall at the foot of an embankment cutting off the toe, or any wall breast high.
Broach—A boring tool, employed for the purpose both of enlarging and imparting accuracy to tapered and parallel holes.
Brob—Wrought-iron spike driven into bars or sills, around the ends of props, to steady them.

CAISSON—Water-tight enclosure, built up as required, to surround foundations under water.
Camber—The bow or upward convexity of material to allow for deflection.
Cantilever—A beam fixed at one end and loaded at the other end, or loaded uniformly.
Cess—The space between the top of a railway embankment and the boundary fence.
Channel-bar—A double-angle section of wrought iron or steel used in framework.
Check—A joint composed of two portions, male and female, fitting one into the other, and so forming a guide or steady.
Chute—An enclosed trough which conducts the water to a water-wheel.
Cleading—Covering of planking or iron plates to strengthen tunnel sides in loose ground.
Cleat—A block of wood which furnishes a steady point of attachment for a part of a structure.
Closer—A brick cut in half longitudinally.
Coffer-dam—Water-tight enclosure of piling or of cast-iron plates bolted together; used in building piers to keep water out of work.
Continuous Beam—A beam which rests on more than two supports.
Coping—A covering of impervious material on the top of a wall, or the curb at the edge of a dock.
Corbel—Short piece of wood interposed horizontally between the head of a post and a supported beam. Also a short cantilever.
Counterbracing—Diagonal bracing introduced into a truss or girder for the purpose of giving additional support.
Counterfort—Projection from the back of a retaining wall, added to increase stability.
Course—A continuous range of stones or bricks, of uniform height, in a wall.
Crab—Small portable crane to raise material.
Cradle—The end girders of overhead travelling cranes which carry the running wheels.
Cramp—Metal tie used for uniting the several stones of a wall.
Creeper—Iron instrument like a grapnel, with four claws, for dragging the bottom of a harbour or river to find anything lost.
Crib—A timber construction filled with rubble stone.
Crib-work—Series of layers of logs, laid alternately lengthwise and crosswise, notched and pinned to each other at their intersections.
Cross Bracing—Diagonal bracing introduced into a framed structure for the purpose of preventing lateral movement.
Crutch—Piece of timber in the shape of a bent knee.
Cuddy—Three-legged stand forming a fulcrum for lever in lifting stones or heavy weights.
Culvert—A drain carried under a road or railway.
Curb—Suitably formed ring of brickwork or cast iron at the base of a shaft, surmounting a circular orifice in the roof of a tunnel.
Cushion—Stone situated upon the top of a pier upon which an arch is built.
Cut and Cover—The operation of making a cutting, building a tunnel in the opening, and then replacing the covering material.
Cutters—Bricks of special quality for cutting to shapes.
Cutwater—Lower portion of a pier separating two arches of a bridge.

DAM—An earthen or masonry wall to retain a body of water, as in an impounding reservoir.
Dead Neap—A very low tide.
Derrick—A form of crane in which the radius of the jib is rendered capable of alteration by means of chains or guys passing over the top of the mast.
Digger—Apparatus used for mechanically excavating earth, etc.
Dike—Term sometimes used in the same sense as embankment.
Distress—A beam or structure is in distress when it is subject to undue or excessive stress, or to an amount exceeding the working stress.
Dolly—Intermediate short post of timber used in pile-driving.
Double Butt Strips—Two covering strips employed in making a butt riveted joint, one strip being placed on each side of the abutting plates.
Dressing—Slopes of embankments and cuttings dressed to a smooth and regular surface.
Drift—Small horizontal or inclined underground passage.
Drove—A narrow channel or drain.
Dumby—A floating barge connected with a pier.

END PILLAR—The vertical part of a lattice girder immediately over the supports.
Enrockment—Term applied to the stone filling upon breakwaters, banks of rivers, etc.
Extrados—The outside or upper surface of an arch.

FACE—Surface exposed by excavation in tunnelling.
Fair—Parts are said to be flush or fair when their surfaces are on the same level.
Fatigue—When the stress exceeds the elastic limit, intermittently or permanently, there is a progressive loss of strength, ending in failure.
Female—The recessed protion of any piece of work into which a dowel or projecting piece fits.
Fender Piles—Timbers placed in front of quay walls.
Fish-bellied—Girders and ribs are said to be bellied, or fish-bellied, when they are curved underneath, the depth of curve increasing towards the centre.
Fish-bolt—A bolt employed for fastening fish-plates and rails together.
Fished Beams—Beams joined by fish-plates.

Fish Pieces—Pieces of wood or iron connecting two pieces of a tie in a fished joint.
Flanks—The sides of an arch.
Flank Wall—The side wall of a building.
Flashes—A description of sluice.
Flitch-plate—A plate of metal bolted between two timber flitches to strengthen them.
Floating Clough—Movable dam or machine used for scouring out inlets.
Floating Derrick—A derrick crane placed on board a floating hull for transferring goods to and from vessels, independently of proper wharf and dock accommodation.
Flow—The condition of a tidal river when running up. A rising tide.
Fluffy—Timber is said to be fluffy when the sawdust is stringy and moist or greasy instead of granular and sharp.
Flush Bolt—A bolt whose head is let into a recessed hole so that its top face stands level with the face of the material into which it is sunk.
Foot blocks—Flat pieces of wood placed under props to give a broad base.
Foresight—The last reading at a level before shifting the instrument.
Formation Breadth—The width of the bed of a railway below the ballast.
Formation Level—The level of a road or railway prepared for the road metal or ballast.
Four-foot—The space between a line of rails over which the traffic runs.
French Drain—A chalk or rubble drain at the back of a retaining wall.
Full—A term which signifies that the dimension is very slightly over the size preceding the term.
Full Way—A waterway is said to be full when the area of the opening in the valve, or plug, as the case may be, is equal in extent to the area of the pipe.

GAD—Wedge of steel for driving into crevices or openings made by pick or chisel.
Gallery—Same as *Drift*.
Galletting—Small splinters of stone inserted in the joints of coarse masonry.
Gantry—The trussed beams, or girders, as the case may be, which carry the crab or crane in overhead travelling cranes; also the timber substructure.
Gibbet—The triangular framework of a crane, consisting of post, jib, and strut.
Gin—A rude, portable, yet effective hoisting machine of the well-known tripod form, from whose apex the pulleys and gin-blocks for lifting are suspended for working heavy tackle. A barrel and winch are fixed between the two legs which form the shears.
Gin-block—A single-sheave pulley of a hollow-rim section, having its bearings in a skeleton frame suspended from a hook. A rope is passed over the pulley, one end of which is held by a man, the load being attached to the opposite end.
Goliath—A travelling crane supported on high trestles moving upon rails.
Grab—A skip or bucket with movable clam jaws, hung from a crane for lifting coal, ballast, etc., without manual labour.
Gradient—The slope of a road, railway, sewer, etc. Stated as 1 in —, according to the horizontal feet distance to reach a change of level of one foot.
Gridiron—A simple framework of timber placed to admit of vessels being floated above it at flood tide and grounded upon it during the ebb for the purpose of examination.
Grillage—Term applied to sleepers and cross beams supporting a platform; also to foundations of rolled steel joints and concrete.
Groyne—A timber framework constructed across a beach between high and low water mark in order to prevent portions of the beach being washed away.
Ground Moulds—A portion of the framework used in tunnelling to guide the bricklayers.
Ground Square—Two straight-edged strips of board the ends of which are so united as to form a right angle.
Grout—Liquid mortar used for running into dry joints in brick or stonework.
Gullet—Small preliminary working cutting about 15 feet wide.
Gusset—An angle-iron bracket used to stiffen an angular portion of a structure.
Gusset Plate—A joint plate in roof and girder work.
Guy—A rope or chain from the top of a derrick pole or shear legs to keep them steady.

HAUNCH—That part of an arch between the keystone and the springing.
Header—A brick placed with its greatest length at right angles to the face of a wall.
Heading—Small horizontal or inclined underground passage driven in advance of the full-sized excavation.
Hedgehog—Machine for removing mud and silt from rivers and streams.
Heel—The thick or broad end of a wedge-shaped piece of wood or iron.
Heel Post—The vertical member at the shore end of a lock-gate, with a pivot at top and bottom upon which it swings.
Hoggin—Small sifted gravel.
Hollow Quoins—Cylindrical recesses in which gates of locks, etc., are hinged.
Horn Plate—The upright frames in which axle boxes slide.

IMPACT—The sudden fall of a load upon a beam or structure. The deflection of beams varies nearly as the velocity of impact.
Impact Wheel—A water-wheel which is driven by the percussive force of water acting at right angles to the floats and at a tangent to the circumference of the wheel. Turbines are impact wheels.
Imposed Load—The load which is extraneous to a structure, and distinguished from that due to the structure itself.
Impost—A sort of capping at the top of a pier supporting an arch.
Impulsive Load—A load applied suddenly to a structure. The structure is thus subject to the accumulation of energy due to the impact of the load, or that gathered in its motion, in addition to its actual dead weight.
Indifferent Equilibrium—The equilibrium of a body which is neither stable nor unstable. If, when a body is moved longitudinally, the centre of gravity moves in a horizontal line, as in a sphere, the equilibrium is said to be indifferent.
Internal Stress—Stress set up in the internal portions of castings, and due to unequal contraction caused by differences in their mass.
Intrados—The under side of an arch.
JIB—The strut or thrust member of the framing of a crane. It is always in compression.
Jib-legs—Timber legs pivoted to the jib pin of a crane. Reaching to the ground, they afford a firm and broad base to the jib when lifting, and so prevent the crane from overturning. When not in use they are shipped over the side frames
Jim-crow—A portable rail-straightener or rail-bender.
Joggle—Keys of hard wood, or other material, used to resist shearing stress at the junction of two beams by being let into the surfaces, the beams being fastened together by vertical bolts in the spaces between the keys.
Journal—The portion of a rotating shaft which is in contact with its bearing.
Jumper—Long iron instrument with sharp steel point for making holes in rock or hard ground.

KENTLEDGE—The loose balance-weights supplied with a balanced crane.
Key—The wedge used to fasten the rail in the chair on railways.
Keystone—Highest stone in the centre of an arch.
King Post—The central upright in a roof truss, against which the rafters abut, and which supports the tie beam.
King Truss—A truss formed with a king post.
Knuckle Joint—A joint in which an eye at the end of a rod is embraced by the forked end of a second rod, the two being connected with a joint pin.

LAP JOINT—A joint produced by the overlapping of contiguous faces of metal.
Lattice—Diagonal bracing forming struts and ties.
Lattice Web—A girder web made by lattice bars, as opposed to a plated web.
Leading-frames—Framework formed to guide bricklayers in making brickwork tunnels.
Leat—Artificial channel for conducting water to water-wheels.
Lengths—Successive sections in which a tunnel is executed.
Lewis—Truncated iron wedge or dovetail, used with larger end downwards, for lifting stones by chains.
Life—Expressive of the total period during which a structure remains efficient.
Life-wall—Cross-wall of a back chamber in a tunnel.
Lining—Term applied to puddle clay reduced to a semi-fluid state, and laid along the bottom and sloping sides of canals, etc.
Lockage—Expenditure of water in passing boats from one level to another.

MALE—When a stud or a dowel fits into a recess it is said to be the male portion of that particular piece of work.
Meeting Post, or Mitre Post—The vertical member of a lock-gate where it meets the other gate.
Metalling—Term applied to the covering of roads generally.
Mitre Joint—A butt joint whose ends are cut at an angle of 45 degrees, the abutting sides therefore forming an angle of 90 degrees.
Monkey—The clip hook which lifts and releases the ram in pile-driving.
Monkey-engine—Apparatus used in driving piles.
Monkey Wheel—See *Gin-block*.
Mushroom—Horizontal single sheaves which act as leads for a rope to a capstan.

NEEDLE—Set of square bars of wood used for opening flood-gates in a weir.

OFF-LETS—Pipes placed at the level of the bottom of a canal and fitted with sluices.
Overshot Wheel—A water-wheel which is turned by the gravity or weight of the water emptying itself into buckets at the top of the periphery.

PENSTOCK—A sluice or flood-gate.

Permanent load—A load which is constant and unvarying and a dead load, as the weight of a structure itself, or a load imposed thereon, or both taken in conjunction as distinguished from a live or a rolling load.

Permanent way—The road bed and rails upon which trains are run.

Pile hoop—An iron band, shrunk on the head of a pile to prevent splitting of the timber while being driven in.

Pinch bar—A bar of iron, or wood shod with iron, used to move heavy loads for short distances by "pinching" them along.

Pitch—Inclination which the sides of a roof make with the horizontal.

Polings—Planks or deal ends, by which the sides of an excavation are supported.

Proof load—A load imposed on a structure greater in amount than the working load, in order to test its capability or margin of safety. The deflection of a structure, when under its test load, is carefully noted and its capability deduced therefrom.

Props—Struts or posts, either vertical or raking, used as supports in tunnelling.

Puddle—A mass of tempered clay, to prevent the passage of water.

Punch—Same as *Dolly*.

Purlins—The members which unite the trusses of roofs in longitudinal directions.

Putlogs—Short poles used for scaffolds.

QUEEN POST—A roof member which fulfils a similar function to that of the king post, its position only being different. Used in pairs.

RABBET, or REBATE—A shoulder or recess on the edge of a piece of wood or metal for the reception of the edge of another similar piece.

Race—Cut along which water is conveyed to and from a water-wheel.

Rail gauge—The width in the clear between the two adjacent sides of the top flanges of the rail upon railways.

Rakers—Same as *Props*.

Ram—Heavy weight dropped on to piles when they are being driven.

Ranging—Laying out the line of a tunnel.

Retaining wall—A wall to hold up a bank of earth, usually battering on the face.

SCARFING—Method of connecting ties or beams, the ends of the two pieces overlapping.

Scouring power—Stream of water employed in connection with harbours to carry away the shingle, etc., to prevent its accumulation at the mouth.

Scuttling—Method of stirring up deposits by mechanical means.

Semi-beam—A beam fixed at one end and loaded at the other or loaded uniformly.

Shearing stress—The stress to which a body is subject when force is applied to it in a direction parallel with its section. Its mean intensity is equal to the shearing force divided by the area of the section.

Shear legs—A rude but strong form of crane, having three legs or pillars of timber or iron, set leaning at an angle towards each other for supporting the lifting tackle. The gear wheels may be attached to one of the legs, or be fixed independently, and hand or steam power may be employed.

Sheet-piling—Row of timbers or piles driven firmly, side by side, into the earth.

Shoe—A cap, or socket, which receives the end of a piece of timber and which sustains the end pull of a truss rod, or takes the thrust of the legs of shears, or carries a pivot or bearing as in pillars of wooden cranes, or acts in a general way as a protection to timber ends, as in pile shoes.

Shore—Pieces of timber placed diagonally against walls, to support them.

Shoulder—That portion of a shaft or a flanged structure where an immediate increase of diameter occurs.

Sills—Strong timbers of large dimensions, placed horizontally across the line of a tunnel to support the props, etc.

Side width—The distance required from the centre line to form a road or railway.

Silt—The alluvial soil washed down and deposited on the bottom and sides of rivers by the action of the tides.

Six-foot—The space between two railway tracks.

Skew-back—Large stones cut to an angle to receive the end of an arch.

Skin-dam—A dam consisting of a single row of sheeting piles of whole or half timber, with tiers of horizontal wallings or planks.

Slurry—Liquid mud or cement mortar.

Soffit—The under side of an arch.

Sough—A small drain, situated at the top of an embankment.

Span—The clear width between the supports of a girder or arch.

Spandril—The portion on the top of a pier between one arch and another.

Spider wheel—A wheel or pulley having light arms of wrought iron or steel.

Spoil, or spoil bank—The surplus material excavated, which is laid by the side of a railway or canal.

Spoon and bar—Tool used in hand-dredging.

Spot Levels—Detached levels taken over a wide area, or at certain irregular positions.

Springing-line—The line in which the soffit of an arch intersects the pier.

Staiths—Short tongues or jetties used for coaling.

Starling—The angular form of a pier-head in bridge work.

Stirrup—A strap which supports a beam or sustains the thrust from one end of a strut.

Strain—The change of form produced in a body by a stress.

Stop-planks—A description of dam employed on canals.

Stress—When materials and structures are subjected to straining forces those forces are resisted by internal molecular actions called stresses. transverse, shearing, or torsional.

Stretcher—A brick with its greatest length placed parallel with the face of a wall.

Striking-plate—The apparatus by which the centre is lowered after the arch of a bridge has been completed.

Struts—These may be vertical or diagonal and connect a beam with a truss rod. Through them the strains due to deflection of the beam are translated into those of tension in the rod. In roof trusses those members which extend diagonally from the beam or from the foot of the king post or queen post either to the rafters or to the shoulders of ths queen posts.

Surcharged wall—A retaining wall to hold back a bank of earth sloping upwards above the top of the wall.

Sump—Hole at the bottom of excavations into which water is drained, and in which the end of the suction pump is placed.

TAIL—The hinder part of a portable crane upon which the balance box rests.

Tee-bars—Rolled wrought iron or mild steel bars whose section is that of the letter T. They are employed in engineering constructions such as bridges, girders, and roof work.

Teeming—Depositing earth in an embankment.

Temoin—Earth pillar left in excavations.

Tenon—A tongue projecting from the end of a piece of timber, and which, with the mortice into which it fits, is one of the common joints in woodwork.

Terring—Scotch term for soil removed in clearing the top of a quarry.

Thimble—Ring attached to a buoy.

Thirl or thirling—Meeting of workings approaching each other from opposite directions in tunnelling.

Thorough—A term applied to the longer heading stones forming a wall.

Thrust—The compressive force exercised by a body transmitting pressure.

Tine—An iron or steel claw used in dredging operations.

Toggle—A bar of iron or wood used to tighten a chain or rope by twisting two lines together.

Tongue—This is a short piece of metal or wood projecting from one portion of a structure and entering into another, in order to ensure steadiness and to prevent overlapping of joints.

Transom—Horizontal framing in bridge work.

Traveller—A framework carrying a lifting crab and able to travel along elevated rails.

Trenail—Wooden pins of large diameter used as fastenings for joints.

Trig station—A place where a theodolite is set up for the purpose of taking an observation.

Truss—Triangular frame in bridge and roof work.

Tunnel—A passage lined with brickwork or masonry, excavated through a hill or below the surface of the ground.

ULTIMATE STRENGTH—The load which produces actual fracture in a structure.

Underpinning—Additions and repairs to foundations and walls in which the latter are first supported by strong timber shores and needles.

VOUSSOIRS—Wedge-shaped blocks forming the arches in bridge-building.

WALES—Horizontal braces.

Waling—A horizontal piece of timber used to hold vertical pieces in place either in an excavation or against a jetty.

Warren girder—A lattice girder in which the struts and ties form triangles or triangular bays, the struts leaning inwards or towards the centre of the girder, and the ties leaning outwards. A Warren girder consists of a single system of triangles, while lattice girders contain two or more systems of triangulation.

Web—The plated or central portion of a structure as distinguished from its flanges and bosses. Thus, a crank web is the plate which carries the shaft and pin bosses; a girder web is the main vertical plate which becomes the connection between the top and bottom flanges.

Weep-hole—A hole for drainage made through a retaining wall or bridge abutment.

Wind Bracing—Horizontal diagonal bracing under footbridge.

Wrinkling—The failure of thin unstayed or improperly stayed plates, by wrinkling up or becoming corrugated under pressure.

TRANSIT

SEE ALSO MOTOR ENGINEERING

ARTILLERY WHEEL—A wheel with wooden spokes mitred together at the centre. The hub consists of two face plates, one of which is in the solid with the box through which the axle arm passes.
Automatic Valve—One which is opened by suction and closed by a spring.

BIG END—The bearing of the connecting rod on the crank pin.
Bogie—A four or six wheeled truck free to move on a central pivot; used under railway carriages and tramcars.
Bolster—An under-carriage member, usually taking the bearing on which it turns.
Bonnet—The engine cover.
Bore—The internal diameter of the cylinder.
Brake, Contracting—A metal strap passing round a drum for retarding the car.
Brake, Expanding—Metal shoes arranged to press internally against a drum.

CABRIOLET—A motor body with head and driver's canopy both folding. The body is fully equipped with glass frames.
Camshaft—The shaft carrying projections which cause the engine valves to rise.
Cant—The plan of the body which shows the side-sweep, turnunder, bevels, and joints of the framing.
Cant-rail—The member which joins the tops of the pillars.
Cape Cart Hood—A waterproof covering supported on wooden hoops. The "one-man" hood works from one pair of body centres.
Carburetter—The device which converts the petrol into a fine spray, and ensures the proper mixture of air for the subsequent explosion.
Cardan Shaft—The member which transmits the power from the gear box to the back axle.
Change Speed Lever—The inner hand lever which, by its movements in the gate, brings the proper wheels in mesh within the gear box.
Chassis—The mechanism of the car.
Clerestory—An additional headroom beyond the roof proper.
Clip—The fastening of the spring to the axle.
Clutch—Usually two cone-shaped members which are engaged by pedal for transmitting the power of the crank-shaft to the gear box.
Compression—The action of the piston in pushing a cylinder full of gas into the head of the cylinder.
Connecting Rod—The member which converts the reciprocating action of the piston into circular crank-shaft motion.
Cooling—The water jacketing of the cylinder. The circulation may be carried out by pump or by the natural upward flow of heated water.
Cylinder—The hollow vessel in which the piston works.

DASH—The division between engine and bodywork.
Differential Gear—A device which connects the halves of a live axle, enabling the hind road-wheels to travel at independent speeds.
Direct Drive—Power transmitted independently of the gear box.
Double Deck—A vehicle provided with roof seats.
Dual Ignition—Ignition provided for by coil and accumulator as well as by a magneto.

EXHAUST PIPE—The pipe carrying the spent gases from the exhaust valve to the silencer.

FELLOE—A curved section of a wheel rim, usually carrying two spokes.
Filling Up—Paint applied to fill up the pores of the panel and provide a foundation for subsequent coats.
First Speed—The slowest speed.
Flatting—Removing the gloss of a varnish coat.
Fly-wheel—The wheel keyed to the back of the crankshaft forming one member of the clutch.
Frame—The pressed steel members which carry the engine and transmission gear, and form the foundation for the body.

GATE—The device near the foot of the change speed lever which guides it so that the selector mechanism operates the proper gears according to the speed required.
Gear Box—The receptacle, usually just behind the clutch, sometimes on the back axle, which contains the change speed mechanism.
Glass-frame—The frame in which a fixed or moving window, or light, is retained.
Glass-frame Carriers—Metal channels for holding a glass-frame above the top of a half door.
Gudgeon Pin—The shaft on which the connecting rod swings in the head of the piston.

HALF-DOOR—A door carried to the waist of the body and not to the roof; used in landaulettes and cabriolets.
Head—The folding leather covering of a landaulette.
Headstock—The front and hind bars of a railway vehicle bottom framing.
Hoopstick—A roof-carrying member.

LANDAULETTE—A side-entrance body, with driving seat and an enclosed hind seat having a folding leather hood.
Lamps—Head lamps are fastened at the front of the car, and side or dash lamps at the dash or front of the body; the tail light is fitted on the off side at the rear if the car is to be used on British roads.
Light—A window.
Limousine—A side-entrance body with driving seat and an enclosed hind seat furnished with side lights.
Limousine-landaulette—As above, but the enclosed portion has a folding leather hood.
Lubrication—System of forcing oil to important bearings by means of a pump geared to the engine.

MAGNETO—A device consisting of horseshoe magnets in which an armature, geared to the engine, revolves and generates current.
Mixture—The combination of gaseous petrol and air.

NEUTRAL GEAR—Idle revolutions of the gears which are arranged by the side lever when the car is stationary, but not the engine.

OBSERVATION CAR—A railway coach designed for look-out purposes.
Odometer—An instrument for measuring distance.
Omnibus—A closed vehicle to carry passengers, often with roof seats.

PHAETON—An open body.
Pillar—An upright member of the framing.
Piston—The cylindrically shaped body which slides up and down in the cylinder.
Piston Ring—A metal collar placed round the piston to render it more gas-tight.
Poppet Valve—The common type of valve, shaped like a long-stalked mushroom.
Propeller Shaft—Cardan shaft, *q.v.*
Pullman—(1) A luxurious railway coach with independent seating; (2) a fully enclosed motor body without partition between driver and other occupants.

RADIATOR—The device—usually in front of the bonnet, but sometimes in front of the dash—for cooling the circulating water of the cylinder jackets.
Radius Rod—A hinged rod which resists the tendency of the back axle to move forward independently.
Rave—The upper horizontal members of a van side framing.
Rim—The metal band which retains the rubber tyre; also one of the wooden members when the periphery of the wheel is in two parts only.
Rocker—A panel below the seat line or body side.
Rubbing Down—Smoothing the filling up with pumice-stone and water.

SALOON—(1) A railway coach with long side seats; (2) a Pullman motor body, *q.v.*
Scuttle—A dash with side and top panels.
Shackle—The joint which allows a spring to lengthen or contract.
Shock Absorber—A device fitted to a spring which absorbs secondary shocks.
Side Sweep—The external horizontal curvature of the body.
Silencer—The final receptacle for the exhaust gas.
Single Deck—Having no roof seats.
Sparking Plug—A porcelain member screwed into the cylinder head, which carries the ends of the high tension wire across which the exploding spark passes.
Speedometer—An instrument for registering the number of miles per hour travelled.
Spring—The elastic member between frame and axles.
Standard—The side pillar of a van.
Standing Pillar—One which embraces a doorway.
Steering Column—This contains a rod which conveys the movements of the steering wheel to the two arms of the front axle.
Stroke—The travel of the piston.

TARE—The unladen weight of a vehicle.
Tilt—A van cover.
Torpedo—A motor body having flush sides.
Trimming—Upholstery.
Tulip—A turnunder in which a straight profile develops at the top into an outward sweep.
Turnunder—The contraction of a body downwards.

UNIT CONSTRUCTION—The assemblage of important chassis components so as to simplify suspension.

VACUUM BRAKE—A brake applying its power by the destruction of a vacuum.
Valve—The device whereby gas is admitted to or expelled from the cylinder.
Van—(1) A four-wheeled trade vehicle; (2) a closed, non-passenger railway vehicle.

WASTING—The rabbet in the framing round a light.
Westinghouse Brake—A brake applying its power by the lowering of atmospheric pressure.
Wheel Base—The distance between the two axle centres.
Wheel Track—The distance between the tyre centres or treads.
Wing—A mudguard.

AERONAUTICS

AERODROME—A flying-ground. Literally, an "air-running."

Aerofoil—The curved wing of an aeroplane, commonly called a "plane." Derivatively, an "airleaf."

Aero-hydroplane—A hydroplane boat fitted with wings so that it flies after reaching a sufficient speed as a hydroplane or skimming-boat.

Aero-motor—An internal-combustion engine designed to be specially light for aircraft.

Aeronautics—The science of aerial navigation.

Aeroplane—A flying-machine propelled by its own engine, the said machine being heavier than air, and supported on wings (or planes).

Aileron—A flap fitted to the tip of an aeroplane wing to control the lateral balance.

Aircraft—Generic term for airships, aeroplanes, and balloons.

Airman—One who possesses extended knowledge of the air and its habits, just as a "seaman" must have experience and knowledge of the sea. Not necessarily an "aviator" or a "pilot."

Air-screw—A revolving helix, generally of wood, driven by an engine to draw or push an aeroplane through the air, exactly as a screw-propeller drives a boat through the water.

Airship—A dirigible balloon, the balloon being generally cylindrical, sausage-shaped, or cigar-shaped, propelled by engines carried in a car (or gondola or nacelle), or cars, slung underneath the balloon.

Anemometer—An instrument for measuring the speed of wind.

Aviatic—Pertaining to aviation (occasionally used).

Aviation—That portion of aeronautics dealing with flying-machines (or aeroplanes) as distinct from airships (or dirigible balloons).

Aviator—One who practises the art of aviation. Correctly applied only to a person holding the "aviator's certificate" issued by the International Aeronautical Federation, represented in the British Empire by the Royal Aero Club. See *Pilot*. Not necessarily an "airman."

BALANCING FLAP—An alternative name for an aileron.

Ballonet—Small air-bags inside an airship, which are inflated with air forced in by a pump to keep the main envelope fully distended. Occasionally used to describe the separate gas-bags of an airship of the rigid (or Zeppelin) type.

Balloon—Any form of envelope used to contain gas lighter than air, with which to lift anything from the ground.

Banking—The operation, generally effected by the ailerons, of turning an aeroplane on to its side when rounding a corner—as a cyclist "banks over" at a turn.

Biplane—A two-decker aeroplane. One with two pairs of wings, one above the other, on two planes.

Body—See "fuselage" and "nacelle."

Bonnet—The cowl covering the engine of an aeroplane.

Bracing—The wires or cables used to tension up and stay the various parts of an aeroplane together. Also used of the wires staying the nacelle of an airship.

CAPTIVE BALLOON—A balloon used as an observation post, and anchored to ground or ship.

Chassis—The landing gear, or undercarriage, of an aeroplane, including the wheels, axle, skids, chassis-struts, and their bracing wires.

Climb—To depress the tail of an aeroplane so as to point the nose upwards for an ascent.

Clinometer—An instrument used to show the degree of climb or dive.

Cockpit—The hole in the fuselage of a "tractor" in which the pilot and passenger sit.

Control-lever—The lever controlling the ailerons, or warp, and elevator of an aeroplane.

Controls—The whole mechanism, including lever or wheel, rudder-bar, ailerons, or warp, rudder, and elevator, and their connecting wires, which control an aeroplane in the air. Also used of airship controls.

DIRIGIBLE—Common phrase for an airship, which is in fact a dirigible (or directable) balloon.

Dive—To stand an aeroplane vertically, or nearly so, on its nose for a rapid descent.

Dope—The varnish, generally non-inflammable, used to render the fabric, or linen covering, of aeroplane wings and fuselages proof against weather, oil, and petrol, and to maintain it properly tensioned up and drum-like.

ELEVATOR—The flap or flaps behind the tail of an aeroplane, which control its vertical path by raising or depressing the tail. They are, in fact, as rudders placed horizontally.

FABRIC—The linen cloth with which the wings, fuselage or nacelle, and control surfaces of an aeroplane are covered.

Fin—A vertical surface fitted to increase the side area (or surface) of an aeroplane or airship.

Flap—A small flat movable surface used to control aircraft. See *Aileron* and *Elevator*.

Fuselage—The body, including the engine, tanks, pilot and passenger seats, etc., from the nose to the tail of a tractor-drawn aeroplane.

GLIDE—To descend at an aeroplane's natural speed by the force of gravity, with the engine stopped or so throttled down as not to exert any driving force. See *Vol-plané*.

Gondel or **Gondola**—The German word, frequently used in England, for the car or cars below an airship.

HALL—The German word for an airship shed. Sometimes used by those in this country concerned with airships.

Hangar—Literally a shed of any kind (in French), but used only seldom in this country to indicate specifically an aeroplane shed. Pronounced rather like "Ongar," in Essex.

Hydro-aeroplane—An aeroplane fitted with floats designed to alight on and get off water. See *Waterplane* and *Seaplane*. It is lifted out of the water by its wings, and need not necessarily "hydroplane" first.

Hydroplane—A motor-boat with a flat or flattish bottom, which skims along the surface of the water. Nothing at all to do with aircraft.

LOOP—To "loop the loop" in an aeroplane is to turn a back somersault in the air by forcing the tail down and the nose up, and keeping there till the machine "climbs" round a circle, or nearly so.

MONOPLANE—An aeroplane with a single pair of wings, both on one plane.

NACELLE—The body containing pilot, passenger, tanks and engine, etc., of a "pusher" machine. Also the car or gondola of an airship. Literally, in French, a "cradle."

PILOT—The person actually controlling an aeroplane or airship.

Plane—Strictly, a plane or flat surface. Commonly used to describe the wings of an aeroplane, which are, in fact, curved. "To plane" is frequently used to indicate the action of planing, or "gliding" down. See *Glide* and *Vol-plané*.

Propeller—An airscrew which pushes. Commonly used for "tractor" air-screws also.

Pusher—An aeroplane driven from behind the wings by a propeller or airscrew, which pushes.

RIBS—The light framework of the wings running across the spars to support the fabric covering.

Rudder—A movable vertical surface fixed above the tail, or partly above and partly below it, to steer the machine on a horizontal path, just as does the rudder of a boat.

SEAPLANE—The official name for any form of waterplane (hydro-aeroplane or aero-hydroplane) capable of operating at sea.

Side-slip—To "bank" too much so that an aeroplane falls down sideways owing to the force of gravity. In a well-designed machine this is followed by a "nose-dive," from which a machine can be easily recovered. Insufficient "bank" on a turn causes an outward side-slip, owing to centrifugal force.

Skid—The horizontal fore and aft bar or bars of a chassis, which slide along the ground like sleigh-runners.

Spar—The main beams of an aeroplane's wings, running from the butt of the wing where it joins the fuselage, out to the wing-tip.

Stall—To "climb" an aeroplane too rapidly, so that it loses speed and halts in the air, an operation often followed by a side-slip and nose-dive.

Struts—The vertical posts, of wood or steel tube, between the upper and lower planes of a biplane. Also the vertical or sloping posts in the chassis.

TAIL—A fixed horizontal aerofoil, or plane, either fitted at the rear of the fuselage of a "tractor" or carried on tail-booms behind the nacelle of a "pusher." It may carry part of the weight of the machine, or it may act merely as a damper to vertical oscillations.

Tractor—An aeroplane drawn by a tractor "air-screw," fitted in front of the wings.

Turnbuckle—The right-and-left screws used to tighten up bracing wires and cables.

VOL PIQUÉ—French for a dive, or "peaked flight."

Vol Plané—French for a glide, or "planing flight." Never used by bona-fide aviators or airmen. See *Glide*.

WARP—To pull down or lift up the rear edge of a wing-plane instead of using ailerons.

Waterplane—A useful generic term describing all forms of aeroplanes usable on and off water, including seaplanes and those only fit for calm waters.

Wing—A single "plane" or "aerofoil" of an aeroplane. A monoplane has two wings, one on each side; a biplane has two on each side.

ZEPPELIN—An airship with a rigid outer frame divided into numerous compartments, each containing a separate cheese-shaped gas-bag.

PRINTING

ACCENTS—Accented letters.
Ads.—Advertisements.
Apron—Flap of paper pasted on matrix.
Ascending Letters—Letters with heads extending above body, as b, d, f, h.
Autoplate—Machine for casting and finishing sterotype plates for newspaper presses.

BACK MARGIN—Inner edge of page.
Bastard Fount—Type with body out of proportion to face.
Bastard Title—Abbreviated title-page.
Beard—Space on body of type allowed for ascending and descending letters; also called shoulders.
Bearer—Type-high metal, used to modify impression.
Bed—Type-carriage.
Bevel—Sloped edge of stereotype plate or letter.
Blanket—Impression pad of wool, felt, or rubber.
Blocks—Mounted plates, or woodcuts.
Bodkin—An awl used in correcting.
Body—Shank of a letter; page without headlines, folios, or footnotes; book, without preface, title-page, &c.
Bourgeois—Size of type (9 points).
Boxes—Divisions of type-case.
Brace—Sign of inclusion, coupling.
Brass Rules—Slips of brass used for printing lines.
Break—End of a paragraph.
Brevier—Size of type (8 points).

CAP.—Capital letter.
Case—Shallow wooden tray divided into compartments for holding type.
Cast—Moulded metal, type or plate.
Cast—See Set-off.
Casting-box—Iron box, holding matrix, in which are cast stereotype plates.
Cast-off—Calculating length of MS.
Catch-line—Words at head of galley denoting contents.
Chase—Iron frame in which type is locked.
Clicker—Workman who distributes copy and makes up pages or columns.
Clump—Type-high metal, put round pages to be stereotyped.
Coffin—Type-carriage of press or machine.
Copy—Manuscript.
Cylinder—Horizontal roller on printing machine.

DESCENDING LETTERS—Letters with tails below the body, as g, p, q, y.
Dis.—Type ready for distributing back into case.
Dressing—Placing forme on machine, and preparing cylinder.

ELECTRO—Electrotype plate of page or picture.
Em-quad—Space the square of depth of type body.
En-quad—Half of em.

FACE—The letter on the type.
Feet—Bottom of type. "Off its feet," type raised or askew.
Flimsy—News copy that has been duplicated on flimsy (tissue) paper.
Footstick—Half-wedge put at bottom of type in chase, for lock up.
Fore-edge—Outer margin of page
Forme—Type locked in chase; specially applied to groups of pages.
Fount—Complete set of one style of type.
Frame—Wooden or iron structure holding type-cases, forming bench for cases in use.
Friar—A light mark on printed sheet.
Frisket—Paper-covered frame, with opening cut to size of type; folded on the tympan to protect the sheet.
Furniture—Metal or wooden blocks used in chase.
Flong—Substance of stereotype matrix.
Fudge-box—Device on press for printing late news into stop-press blank.

GALLEY—Tray for holding type when it is set.
Galley Press—Press for proofing type on galley.
Galley Proof—Slip printed from galley.
Gripper—Bar set on cylinder to take on sheets.
Gutter—Space between pages in forme.

HAIR SPACE—Thinnest of spaces, eight to the em.
Hand Roller—Ink roller of hand press.
Hot Plate—Steam-heated plate for drying stereo matrix.

IMPOSING STONE—Table on which set type is prepared for printing or stereotyping.
Imposing Schemes—Method of placing pages so that they will print in order.
Impression—Stamp of type on paper.
Impression Cylinder—Cylinder carrying and impressing the sheet on type.
Imprint—Name and address of printer.
Indent—Space shortening first line of paragraph.
Inferiors—Index figures or letters, smaller than type body, ranging with bottom of letters.
Inner Forme—Set of pages containing the second and second last pages of a sheet.
Italic—*Sloping type, like this.*
Inset—Supplementary matter.

JOB—Any work not a book or pamphlet.
Jobbing—Doing odd work; commercial printing; small jobs.
Justify—Spacing out the line; setting different sizes of type to each other.

KISS—Rollers coming into contact.
Knocking up—Making sheets lie evenly over each other.

LAY OF CASE—Arrangement of type in case.
Leads—Lead slips used for making spaces between lines.
Linotype—Machine for composing and casting solid line of type, or "slug."
Locking up—Wedging type in chase.
Long Primer—Size of type (10 points).
Lower-case—Small letters; the case used for the small letters.
Lye—A type-cleansing liquid, usually made of potash.

MS.—Author's copy.
Make Even—Finishing copy at end of line.
Make up—Putting type together into pages or size of job.
Making Ready—Preparing tympan or impression cylinder for printing.
Mangle—Machine for rolling flong into type to produce matrix.
Matrix—Mould of type or plate.
Measure—Length of line, expressed in ems of pica.
Minion—Size of type (7 points).
Modern—Plain Roman type.
Monk—Black spot on sheet, caused by inkstain or other dirt.
Monotype—Two machines (keyboard and caster), for composing and casting lines of separate types.

N.P.—New paragraph.
Nicks—Marks on front of type shank.
Nonpareil—Size of type (6 points)
Numbers, long and short—Large and small quantities.

O.S.—Old style. Modern imitation of antique type.
Octavo—Sheet folded into eight leaves.
Outer Forme—Forme containing first and last pages of a sheet.
Overlay—Sheet patched to produce good impression.
Overrun—Altering the measure of type to take in corrections, or to go round an illustration.

PACKING—Sheets of paper and blanket in tympan or on cylinder to graduate impression.
Perfect (to)—Print on both sides.
Pica—Size of movable type first used; standard of measurement (12 points).
Pie—Type thrown into disorder.
Planer—Flat block of wood for levelling down type.
Platen—Impression plate of hand press or machine.
Point—One-twelth of pica—1/72 in.
Process Blocks—Illustrations produced by a photographic process.

QUADS—Spaces larger than em.
Quarto—Sheet folded twice, giving four leaves.
Quoin—Wedge for locking type in chase.

READER—A corrector of proofs.
Register—Adjustment by which pages print exactly back to back, or one colour exactly on top of another.
Reglets—Wood slips for spacing bill lines.
Rollers—Ink distributors.
Roman—Common type, not italic.
Rotary—Type-cylinder machine.
Rough Proof—Rough impression of type pulled for correction.

SANSERIF—Form of type without fine strokes at terminations of lines. Like this: **SANSERIF.**
Screw-chase—Chase fitted with screws for locking up instead of wedges and quoins.
Serif—Fine lines at ends of letters.
Set-off—Smudging of sheet at second impression by impression cylinder or tympan fouled by ink from first printing.
Setting-rule—Slip of brass against which the compositor sets, shifting it line by line.
Setting-stick—Small hand tray with movable bar for holding type being set.
Shooter—Wedge for driving quoins.
Sidenotes—Notes on margin of page.
Sidestick—Half-wedge laid on side of page for locking up.
Signature—Printer's letter to mark number of a sheet—*i.e.*, in a book, etc.
Small-cap—Capitals same depth in face as lower case.
Slur—Defective impression.
Sorts—Special letters of a fount.
Space-band—Wedge device on linotype for justifying lines.
Spaces—Type without face for making space between words.
Stereotype—Metal cast of page secured from matrix.
Stick—*see* Setting-stick
Stop-press—Space for late news.
Superiors—Small index figures or letters, to range with top of letters.

TAKE—A share of copy.
Thick Space—Space, three to the em.
Thin Space—Space, five to the em.
Tweezers—Small pincers for picking out letters.
Tympan—Parchment-covered frame on hand press that carries the sheet on to type.

UNDERLAY—Sheet or patchings put under type or stereo-plates to regulate impression.
Upper-case—Capitals; the case used for capital and small-capital letters, figures, etc.

VIBRATOR ROLLERS—Rollers conveying ink from ductor to ink slab.

WAVER ROLLERS—Rollers set diagonally to distribute the ink.
Web Machine—Machine supplied with paper from a reel.
Wrong Fount—Letter of different character from the fount being used—marked w.f. on proof.

BIOLOGY

ABDOMEN—In vertebrates, the hinder part of the trunk, containing the principal organs of digestion and excretion.
Abiogenesis—Spontaneous generation, or the production of living beings without pre-existent life.
Accretion—The process by which inorganic bodies grow larger.
Acquired Characters—Characters acquired by the individual, as distinct from those bestowed by heredity.
Adaptation—The adjustment of animals or plants to surroundings.
Adolescence—The period between childhood and manhood or womanhood.
Ætiology—The science of the causes of diseases.
Albinism—Whiteness or paleness.
Albumen—The complex substance of which, *e.g.*, white of egg is composed.
Algæ—An order or division of the cryptogamic or acrogenous plants.
Allelomorphic Characters—Characters that are opposed (a Mendelian term).
Ambergris—A concretion formed in the intestine of the sperm-whale.
Amitotic—Simple cell-division, usually marked by the dumbbell-like construction of the nucleus.
Amœba—A unicellular animal which changes its shape.
Amœboid—Like an amœba, changing in form.
Amphibia—One of the five classes of vertebrates.
Amphimixis—The sexual mode of reproduction.
Anabiosis—The return to life after apparent death.
Anabolic—Creative or constructive.
Anabolism—The chemical processes which build up the tissues.
Analogous—Having the same function.
Anatomy—The study of structure.
Ancestral Inheritance—Sir Francis Galton's law of heredity which asserts that the factor of inheritance from the parents is one half, from the grandparents one quarter, and so on.
Animism—The attribution of life to natural phenomena, such as the thunder, the river, the avalanche, and so on.
Antenna—A feeler of an insect.
Anthropography—A description of man or of the human race; or of the distribution of our race in respect to situation, language, custom, etc.
Anthropoid—Resembling man.
Anthropology—The natural history or physiology of the human species.
Aorta—The great artery of the body.
Archebiosis—Another term for abiogenesis.
Asexual—Reproduction in which sexes are not concerned.
Atlas—The name of the first vertebra in the neck.
Atrophy—A wasting away of the body.
Auricle—One of the cavities of the heart.
Autogamy—Self-fertilisation.
Aves—The class of birds.
Axis—The second vertebra of the neck.

BILATERAL SYMMETRY—Having right and left sides alike.
Biochemistry—The science that studies the chemistry of life.
Biodynamics—The doctrine of vital forces or activity.
Biogenesis—The doctrine that all living matter has directly descended from pre-existing living matter.
Biogenetic Law—The recapitulation doctrine, the tendency for the individual to recapitulate stages in the history of the race.
Biology—The science of life and living things.
Biometrics—The application of mathematical methods to the statistical study of life.
Biotic Energy—The energy phenomena witnessed in living matter.
Biparous—Bringing forth two at a birth.
Biped—An animal having only two feet.
Blastophthoria—Germ-cell poisoning.
Blastula—A hollow ball of cells.
Blood—The fluid which circulates through the arteries and veins of animals.
Blood Relationship—Species that are related by nearness of blood constituents (anthropoid apes and man, for example).
Blubber—A thick layer of fat under the skin.
Body Cavity—The space within the body-wall.
Botany—The modern study of plants, a division of biology.
Brachial—Pertaining to the arms.
Branchial—Pertaining to the gills.
Bronchus—A branch of the windpipe.
Bud—An outgrowth which becomes an individual animal.
Budding—One of the methods of cell reproduction.

CALCAREOUS—Pertaining to lime.
Canine—Dog-like, applied to certain teeth.
Carnivorous—Flesh-eating.
Carpus—The wrist, the small bones between the forearm and the hand.
Cartilage—Gristle.
Caudal—Pertaining to the tail.
Cell—The unit of structure, a nucleated mass of protoplasm.
Centrosome—A minute body found within a cell.
Cephalic—Pertaining to the head.
Cerebellum—The small or hinder brain.
Cerebral Hemispheres—The highest part of the vertebrate brain.
Cervical—Pertaining to the neck.
Chemiotaxis—A property of attraction drawing, *e.g.*, micro-organisms or their products to the white corpuscles of the blood.
Chemotropism—The response to chemical stimulation.
Chlorophyll—Green colouring-matter of plants.
Chloroplasts—Organs embedded within the cytoplasm of the plant in which the process of photosynthesis takes place.
Choroid—The pigmented middle coat of the eye.
Chromatin—Colourable matter found in the nucleus of cells.
Chromosomes—The pieces into which the cromatin network of the dividing nucleus breaks up; colour bodies.
Cilia—Hair-like, minute filaments projecting from the surface.
Ciliary Action—The movement of cilia.
Clavicle—The collar-bone.
Climacteric—The change of life. The menopause.
Cloaca—The cavity into which the excretory organs open, as in a frog.
Cnidoblasts—Stinging cells.
Commensalism—The association of two organisms to the advantage of one or both.
Conifers—Cone-bearing plants.
Conjugation—The fusion of two individuals for reproductive purposes.
Continuity of the Germ Plasm—August Weismann's theory of heredity; the persistence of specialised cells throughout consecutive generations for the production of new life.
Convergence—The tendency for organs and species to resemble each other.
Corpuscle—Small cells or particles.
Cosmozoa—The idea that life has existed in the Universe from eternity, and has simply been transferred from one world to another.
Crop—A part of the gullet for temporary food-storing.
Cross-fertilisation—Fertilisation of an egg by a sperm from another organism.
Cross-pollination—Transferring pollen from the stamen of one flower to the stigma of another.
Crustacea—One of the classes of articulated animals.
Cyclops—Possessing a single eye, a family of very minute crustacea.
Cytode—A simple portion of protoplasm without a nucleus.
Cytology—The study of cells.
Cytoplasm—Protoplasmic matter of a cell.

DARWINISM—The doctrine of the origin of species by natural selection.
Death—Cessation of the activities of life.
Degeneration—The process by which organisms become parasites or fixed.
Development—A series of changes in the early life of an animal during which it passes from the state of a single fertilised cell to the adult condition.
Digitigrade—Walking upon the digits.
Digits—The fingers.
Distal—The end of a limb or extremity farthest from the trunk.
Dorsal—Pertaining to the region of the back.
Dysgenic—Anti-eugenic.

ECTODERM—Outer cellular layer of the organism.
Élan Vital—Professor Bergson's phrase for the push, thrust, will, or force that underlies all life, the vital urge.
Embryo—The young animal during development within the egg or womb.
Embryology—Science of development.
Endoderm—The inner cellular layer of an organism.
Endoskeleton—Internal hard supporting structures, as bones.
Entoderm—A layer of cells round the yolk sac.
Environment—The surroundings.
Epiblast—The outer layer of cells of the blastula.
Epigenesis—Gradual development from the simple to the complex.
Eugenics—The science of good begetting; race culture.
Evolution—The unfolding of successive phases of development in the growth of animal and vegetable organisms.
Excretion—The throwing off of waste products from the system.
Exogamy—The custom of marrying outside one's own clan.
Exoskeleton—External hard supporting structures.

FACTOR—The representatives, in the germ plasm, of the characters of the organism. A Mendelian term.
Femur—The thigh-bone.
Ferments—Special substances having the property of facilitating and hastening chemical actions.
Fertilisation—The fusion of two germ-cells.
Fission—Reproduction by splitting of the parent cell.
Flagella—Long, whip-like outgrowths of a cell.
Fossils—The remains of organisms or their traces in rock.
Fungi—In botany, a large natural order of cellular and flowerless plants.

GAMETE—An unfertilised germ-cell.
Gemmation—Reproduction by budding.
Genesis—Herbert Spencer's term for the proportion of energy expended upon the race. See *Individuation*.
Genetics—The modern scientific study of heredity.
Genus—A group including one or more species.

Gill—An organ for breathing the air contained in water.
Gizzard—A part of the digestive tube in which food is broken up.
Gland—A soft, secreting organ of the body.

HÆMOGLOBIN—The colouring-matter of the blood.
Herbivorous—Feeding on plants.
Heredity—The relation between parents and offspring in respect to certain characters.
Hermaphrodite—Having the two sexes united in one individual.
Heterozygotes—Hybrids derived from mixed zygotes.
Hibernation—Passing into a torpid winter condition, as in reptiles.
Histology—Science of minute structure.
Homogamy—The mating of like with like.
Homologous—Having a similar organ; constructed on a similar plan.
Homozygote—True breeding individuals containing only one kind of gamete.
Hormones—Chemical substances formed in epithelium which excite the secretion of glands.
Host—The organism that carries a parasite.
Hybrid—An individual produced by crossing two species.
Hypoblast—The inner layer of the blastula.

IMAGO—The adult stage of insects.
Incisor—The front tooth in mammals.
Individuation—Herbert Spencer's word for the proportion of energy expended upon the individual.
Instinct—A natural impulse, impelling organisms to do that is necessary for existence.
Intussusception—The continual absorption of new material from without, and its transformation in the substance of the body.
Invertebrate—Without a backbone.
Irritability—The property by which an organism responds to stimulation.

KARYOKINESIS—Complex cell-division, involving a division of the chromatin of the mother-cells between the daughter-cells.
Katabolic—Disruptive, the contrary to anabolic in vital metabolism.

LABIUM—A lip.
Labrum—The upper lip.
Larva—A young animal which has left the egg and is free, but incompletely developed.
Life—The state or condition of a being which grows and which reproduces itself.

MACRONUCLEUS—The large nucleus in some organisms.
Mammals—A class of Vertebrates that suckle their young.
Maturation—The process of chromatin reduction in the nucleus in preparation for fertilisation.
Melanism—Unusual darkness of colour.
Mendelism—The science that studies heredity along the lines laid down by Gregor Mendel in 1865.
Mesoderm—The middle cellular layer of organisms.
Metabolism—Chemical changes in the body.
Metamorphosis—The period in the life of some insects during which the change occurs from the larva to the imago.
Metazoa—Many-celled animals.
Micronucleus—The small nucleus in some organisms.
Mimicry—Resemblances between species, often for protection.
Miocene—A term applied to the middle division of the tertiary strata.
Mitosis—See *Karyokinesis*.
Monogamy—The marriage of one wife only.
Monotremes—The lowest mammals.
Morphology—Science of structure.
Morula—A solid ball of cells.
Mutations—Differences in species due to changes in the inheritance—to the alteration in the germinal constitution.

NATURAL SELECTION—The survival of individuals which possess advantageous variations.
Necrobiosis—The gradual transition between life and death.
Neural—Pertaining to the nervous system.
Notochord—A supporting rod under the central nervous system in all vertebrate embryos, usually replaced later by the backbone.
Nucleus—The specialised portion of protoplasm within a cell.

OCCIPITAL—Pertaining to the back of the head.
Omnivorous—Having a mixed diet.
Ontogeny—Individual development.
Organic Evolution—The evolution from the primal and simple forms of life to the complex and highly specialised forms of today.
Osseous—Bony.
Ovary—The female sexual gland.
Oviduct—The tube from the ovary to the exterior.
Oviparous—Producing eggs, or producing young from eggs.
Ovoviviparous—Producing young from eggs hatched within the body.
Ovum—The female sexual cell, the egg.

PANGENESIS—Charles Darwin's theory of heredity to explain the Lamarckian doctrine of the inheritance of acquired characters.
Panspermia—See *Cosmozoa*.
Parasite—An organism which lives on or in another.
Parthenogenesis—Production of new individuals from unfertilised eggs, and therefore without the male gamete.
Pentadactyle—Having five digits.
Permanent Dentition—The second set of mammalian teeth.
Photosynthesis—The manufacture by the green plant, in the presence of sunlight, of its own organic compounds.
Phylogeny—The evolutionary history of animals.
Phylum—A large division of the animal kingdom—*e.g.*, Vertebrates.
Physiology—The science which describes and endeavours to explain the phenomena manifested by living beings.
Pia Mater—A thin membrane which encloses the lobes of the brain.
Plantigrade—Walking upon the palms of the hands or soles of the feet.
Pleistocene—The Glacial or Ice Age.
Pliocene—The name given to the topmost division of the Tertiary system in geology.
Polygamy—Plurality of wives at the same time.
Protoplasm—Physical basis of organised tissues; simplest form of living matter.
Primates—The highest apes and man.
Protozoa—Lowest division of the animal kingdom: one-celled animals.
Pseudopodia—Processes pushed out by unicellular organisms for the purposes of locomotion.
Psychology—The study of behaviour.
Pupa—A stage in insect life.
Pure-lines—A line including all the descendants of a single individual, belonging to a race which is reproduced exclusively by self-fertilisation.

RACIAL POISONS.—Those poisons which, while injurious to individuals as individuals, also injure future generations by poisoning the germ-plasm.
Regeneration—The process of repair after injury.
Regression Towards Mediocrity—A law asserted by Sir Francis Galton that the offspring of those who are above or below the mean of a race tend to return toward that mean.
Reptiles—One of the division of Vertebrata.
Reversed Selection—The selection of the worst types for the purpose of parenthood.
Reversion—The appearance of traits like those of remote ancestors.

SECONDARY SEXUAL CHARACTERS—The differences between the two sexes, other than that of the reproductive organs.
Segmentation—Early divisions of an egg after fertilisation; also the division of an individual into rings or segments.
Self-fertilisation—Fertilisation of an egg by a sperm from the same individual.
Self-pollination—Transference of pollen from stamen to stigma of the same flower.
Sex—The essential difference between male and female.
Sexual Selection—A special kind of natural selection taking place within the limits of an interbreeding set of animals or "species."
Sociology—The science that studies society.
Soma—The body, as distinct from the germ-cells.
Somatic—Pertaining to the body as opposed to the germ-cells.
Special Creation—The belief that species were created independently.
Spermatozoon—The male sexual cell.
Spinal Cord—The spinal part of the central nervous system.
Sterility—The inability to reproduce offspring.
Stigma—An air-tube in insects. The pollen-receiving organ in plants.
Stirpiculture—Sir Francis Galton's original name for eugenics, the cultivation of "stirps" or stocks.
Stomata—Openings in plants for the supply of carbon dioxide, situated in the epidermis of the leaves.
Synthesis—Building up, creating, adding together.

TELEGONY—The supposed influence on the progeny of a female of a sire with which she had been previously mated.

UNGULATES—The hoofed mammals.
Unicellular—Organisms having only one cell.

VACUOLE—A space in the protoplasm of a cell.
Variation—The appearance of new traits.
Vegetative Propagation—Reproduction by other methods than egg production—*e.g.*, budding or fission.
Ventral—Pertaining to the lower aspect of the body.
Vertebrata—Backboned animals.
Vestigial—Pertaining to an organ which has undergone reduction.
Viscera—Organs within a body cavity.
Visceral Clefts—The slit-like openings on each side of the throat which every vertebrate embryo exhibits.
Viviparous—Producing young alive.

WARNING COLOURATION—Conspicuous colouration of organisms which have dangerous or unpleasant traits.

ZOOGEOGRAPHY—The distribution of animals on the earth.
Zoology—The science of animals.
Zygote—A fertilised germ-cell.

BUSINESS

FOR TERMS NOT GIVEN HERE, SEE THE INDEX

A.a.r. or a.r.—Against all risks.
Abandonment—In marine insurance, a notice of surrender of insured property to the underwriters, prior to a claim on them for total loss.
Abatement—An allowance made in an account, or in respect of goods.
Above Par—When the price of stocks and shares is above their face value.
Abstract Ledger—A book in which is recorded the cost of the labour and each material supplied for a contract.
A/c—Account.
A/C—Account current.
Acceptance—The signing of a bill of exchange, whereby the acceptor or person signing makes himself responsible for payment. See Index.
Acceptances—Bills accepted by a bank or firm, and reckoned among the liabilities of the acceptors to the payee.
Acceptance supra Protest—Where a bill has been protested, and is accepted by another person to prevent the bill being dishonoured and the drawer's credit impaired.
Accepted Bill—A bill of exchange after the drawee has written *Accepted* across it, with his name and the date.
Accommodation Bill—A bill drawn by one person and accepted by another for the convenience of the first, though no consideration has been given for it. The drawer promises to pay the bill when it falls due. Also called Wind Bills and Kites.
Account Current—A copy in Dr. and Cr. form of a person's account, as shown in another's ledger.
Account Sales—An account showing particulars of sales effected and expenses incurred by an agent on behalf of a principal.
Acquittance—A written discharge in full of some debt or liability.
Active Bonds—Bonds bearing a fixed rate of interest, and payable in full from the date of issue.
Active Circulation—Notes of a bank actually in the hands of the public.
Act of Bankruptcy—An act by which a debtor becomes liable to be adjudicated a bankrupt.
Act of God—Perils beyond human control, such as those resulting from wind, weather, lightning, etc.
a/d—Ante-date. To date a document before the true time.
A/d—After date.
A/D—Alternate days (advertising).
Ad interim—Lat. In the meanwhile.
Adjudication Order—An order of the Court declaring a debtor bankrupt.
Adjustment—Settlement of a claim, particularly of an insurance claim.
Ad referendum—Latin. To be further considered.
Ad val.—Short for Ad valorem.
Ad valorem—Latin. According to value and not quantity. Used of Customs duties. Also written A/V.
Advance Note—A draft on the owners of a ship for a month's wages, given by the captain to the seamen, and payable after the vessel sails.
Advice—Notification regarding mercantile transactions, especially despatch of goods.
Advice Note—A note sent by a railway company stating that certain goods are at one of their stations, and asking for instructions.
Affidavit—A sworn written declaration.
After date—Used in bills of exchange, meaning after the date of the bill.
After Sight—This term in a bill of exchange means that it must be seen by the drawee, and the date of his acceptance inserted.
a.g.b.—A good brand.
Agenda—Memoranda of business to be done. See page 2987.
Agent—One authorised to represent another or to buy or sell for him. See Commission Agents.
Agio—Difference in value between various kinds of money of the same country and denomination. Also difference between real and nominal value of money.
Allocate—To allot.
Allonge—A slip of paper attached to a bill of exchange to provide room for further indorsements when the back of the bill is covered.
Allotment Note—A draft drawn by seamen on the owners of a ship for the monthly payment, while they are away, of a portion of their wages to those dependent on them.
All Round Price—A price which includes all extras.
Amortisement—The redemption of bonds or shares by periodical drawings from a sinking fund.
Anchorage—Dues paid by a berthed ship for the use of quays,
Annuity, Deferred—An annuity beginning after the expiration of a certain period.
A/o—Account of.
Appraiser—A person licensed to value property.
Arbitration of Exchange—A comparison of the direct rate of exchange for remittance between two countries with that obtained by remitting through intermediate places, to see which is more advantageous. When through one intermediate place, it is simple arbitration; when through more, compound arbitration.
Articles of Association—A deed of the internal regulations of an incorporated company by which the management of the business is governed.
A/S—Account sales.
As per advice—A term on a bill of exchange, meaning that the drawer has given notice to the drawee that the bill has been drawn on him.
Assignment—The transfer of property or rights to another, called the assignee. Also the document of transfer.
"A" Stock—See Deferred Stock.
At sight—A term used on bills of exchange that are payable on demand and do not require accepting.
Audit—An examination, by qualified auditors, of books, accounts, etc., to see that they are in order and that no fraud or mistake has been made.
A/V—Ad valorem.
a/v—A vista. At sight.
Av. or Average—A term in marine insurance, meaning a contribution upon all parties concerned to meet the losses. *Particular average* is the contributions to which the underwriters are liable for the partial loss of property by any of the accidents against which insurance has been made. *General average* is a contribution made by the owners of the ship, freight, and cargo to cover the value of any property thrown overboard or destroyed to save the rest. The proportion to be borne by each of the insured interests is drawn out by an average adjuster or stater.
Average Bond—A document made out by the captain of a ship that has incurred a general average loss, and signed by the consignees of the cargo before the goods are delivered to them. Both parties are thus held liable for their proportion of the loss.
Average Clause—A clause in a marine insurance policy, stating that certain articles shall be free from average unless general, and that others shall be free from average if less than a certain percentage named.
Averaging—Buying more stock or goods at a lower price than a previous purchase, in order to reduce the average cost.

B/—Bale or bag.
Back—See Backwardation.
Backed Note.—A receiving note with a shipbroker's endorsement authorising goods to be barged alongside the ship.
Backwardation—The rate paid by speculative sellers of stock for being allowed to carry over from one fortnightly account to another instead of selling.
Bailment—The delivery of goods to a person for a particular purpose.
Bank Bills—Bills of exchange issued by a bank.
Bank Post Bills—Bills of exchange issued by the Bank of England, payable to order seven days or sixty days after sight.
Bank of Deposit—A bank which receives money on deposit at an agreed rate of interest.
Banks of Issue—Banks which issue their own notes.
Barratry—Fraud or criminal conduct of the master or mariners of a ship, whereby the owners or the insurers of the ship or cargo are cheated.
Barter—Exchanging of goods for goods.
Basis Price—A price that does not include the extras charged in trade for quality, size, etc.
Bd.—Bond or bound.
b/d—Brought down (bookkeeping).
B/E—Bill of exchange.
Bear—A speculator who sells for future delivery stocks or shares he does not at present possess, hoping to buy them in the meantime at a lower rate.
Bearer Cheque—See Cheque to Bearer.
Bearer Securities—Any security, such as stocks, bonds, etc., which may pass from hand to hand. Bearer securities are not enrolled on any list, and are therefore proof of ownership.
Bear Squeeze—See Corner.
B/F or B/f—Brought forward.
Below Par—When the price of stocks and shares is less than their face value.
Bill of Entry—A statement to the Customs officials, in prescribed form, giving particulars of goods imported or shipped.
Bill of Health—A certificate given by the Customs to the captain of a ship as it leaves port, describing the state of health then prevalent at the port.
Bill of Sale—A contract making an absolute or conditional transfer of title to goods as security for debt
Bill of Sight—A provisional form of Customs declaration by an importer when ignorant of the exact nature or quantity of the goods landed. Later he makes a correct Bill of Entry.
Bill of Store—A Customs licence allowing a vessel to carry free of duty such dutiable provisions and stores as are needed for the voyage.
Bill of Sufferance—An authorisation by the Customs authorities giving permission to coasting traders to carry dutiable articles from one port to another, the goods being landed on sufferance wharves.
Bill Payable—A bill of exchange or promissory note the amount of which is payable by giver at a future date named therein.
Bill Receivable—A name given by the holder to bill of exchange due to him.
Bimetallism—A money currency based on a double standard of value—one of gold and one of silver.
Bl—Bale.
B/L—Bill of lading.
Blending—See Bulking.

Blockade—A bill of lading term meaning that a port is so surrounded by the enemy that no ship can enter.

B/o or b/o—Brought over (bookkeeping).

B.O.—Buyers' option.

Boarding Stations—Places where ships bring to, so that the Customs officers may board them for examination.

Bond—A document by which a person or company agrees to pay a certain sum at a stated time or in certain circumstances.

Bond, In—Goods liable to pay duty may be stored in a Government or licensed warehouse, and the duty remain unpaid till the goods are wanted. Such stored goods are said to be "in bond." The importer signs a "bond note" that he will pay duty when he clears the goods.

Bonded Carman—A carman licensed by the Customs authorities to handle and convey dutiable goods.

Bonded Warehouse—A warehouse sanctioned by the Board of Customs for the deposit of goods in bond.

Book Debts—Unpaid debts owing to a trader as shown by his books. They may be good, doubtful, or bad.

Bottomry—The making of a contract, set forth in a bottomry bond, whereby a ship and its tackle are mortgaged by its captain or owners to obtain money for special purposes, such as repairs. See also Respondentia.

Bought Note—A written contract sent by a broker to his principal, giving details of goods bought on commission.

Bounty—A premium paid to exporters by the Government to encourage a particular industry.

Bourse—A Continental Stock Exchange.

B/P.—Bills Payable or Bill of Parcels.

B.P.B.—Bank Post Bill.

B/R.—Bills receivable.

Breaking Bulk—Unloading any part of a ship's cargo after her arrival in port.

Broker—A middleman between buyers and sellers.

Brokerage—Remuneration to a broker.

Broker's Note or **Broker's Order**—Same as Backed Note, which see.

B/s.—Bales or bags.

B/S.—Bill of sale.

"B" Stock—See Preferred Stock.

Bt.—Bought.

Bucket Shop—The office of an outside stockbroker—that is, one who does not belong to the Stock Exchange.

Bulk—The total amount of goods stowed in a ship's hold.

Bulking—The operation of putting the whole of a parcel of tea, or coffee, or cocoa, etc., together into one bulk, and, after mixing, replacing in the packages.

Bull—A speculator who buys stocks, hoping to sell at a high rate before the time of settlement arrives.

Bullion Operations—The import and export of gold to create funds for exchange operations.

Buoy Dues—Dues payable by ships entering a port near which buoys are placed to guide and warn vessels.

Burden—The number of tons a ship will carry.

Bureau de Change—A commercial house or bank where foreign money is dealt in and exchanged.

Buyer's Option to Double—See Call of More.

Buyers Over—A market term meaning there are more buyers than sellers.

Buying In—When a seller has not delivered his securities to the buyer on the date arranged, the buyer can buy in against the seller, who is liable for all expenses in getting delivery.

Buying on Commission.—Buying for a principal, and charging a commission.

C/—Currency or coupon.

C/—Case.

C/A—Capital account.

Cable Transfer—See Telegraphic Transfer.

Call—A demand for money in payment of an instalment due on shares in a public company; also Stock Exchange term for an option to buy.

Call Letter—The notice making a call.

Called Bond—A bond called in for payment on a specified date, after which it no longer bears interest.

Call Money—Money lent at interest by bankers to billbrokers against security for repayment at a moment's notice.

Call of More—Stock Exchange term for the right of a buyer to "call for"—that is, buy on an agreed future date an equal quantity of stock to that first purchased. Elsewhere it is called "Buyer's Option to Double."

Cambist—One who exchanges foreign money, or deals in foreign notes, etc.

Capel Court—The Stock Exchange.

Capital Account—The account of the capital stock of a company. On one side are shown the subscriptions of shareholders; and on the other charges against capital.

Capitalise—To convert wealth or property into capital, so that it may be used for trading, etc.

Captain's Copy—An unstamped copy of a bill of lading for use of captain.

Captain's Draft—A draft by the captain of a ship on her owners or the brokers, for charge due by the ship.

Captain's Entry—A provisional entry by the captain when the merchant has failed to make the prime entry within the required time.

Cargo—The whole of the merchandise carried on a ship.

Cargo Book—A book kept by shipbrokers with details of all the merchandise shipped on their vessels, with weights, marks, etc.

Carriage Forward—The carriage to be paid by the receiver.

Carrying Over—A term used on the Stock Exchange for postponing the settlement of an account from one settling day to another.

Cartage—Same as Carriage.

Cartage Note—An account for cartage.

Cart Note—A note sent by the Customs authorities with locked vans when dutiable goods are moved from one place to another for warehousing or shipment.

Case of Need—A term used in an endorsement on a bill of exchange, thus: "In case of need, apply to Messrs. Brown & Jones." It means that the party named guarantees payment for the honour of the drawer should the bill not be met when due.

Cash—Ready money—coin, banknotes; also drafts, bonds, and other readily negotiable instruments.

Cash Articles—In banking, bills and cheques sent out for collection.

Casting—Adding up figures.

C.B.—Cash book.

c/d—Carried down. (Bookkeeping.)

Central Institution—Bank of England.

Certificate of Damage—A document issued by a dock company when imported goods are landed damaged.

Certificate of Incorporation—A certificate given by the Registrar of Joint Stock Companies, after all the registration requirements have been fulfilled, declaring that the company is duly registered and is incorporated under the Companies Act.

Certificate of Origin—A certificate signed by the exporter or his agent declaring the country of origin of the goods shipped.

Certificate of Registry—See Ship's Certificate of Registry.

Certificated Bankrupt—One who has a certificate from the Bankruptcy Court freeing him from his liabilities.

Certified Transfers—A transfer deed bearing an endorsement by the secretary or registrar of a company to the effect that share certificates to meet the transfer have been lodged at the company's office.

Cessio Bonorum—In Scotland the giving up by an insolvent debtor to his creditors of the whole of his property.

C.F.—Carried forward.

c.f.—Cost and freight.

c.f. and i.—Same as c.i.f.

Cgo.—Contango.

C.H.—Custom House.

Chamber of Commerce—A local association of commercial men formed to regulate and protect trade interests.

'Change—Short for Exchange. Going on 'Change means attending the market.

Charges Forward—A term used when carriage and other charges are to be paid by a buyer on receiving goods.

Charter—To charter a ship is to hire her.

Charter—A grant from the Crown conferring special privileges on a company upon the fulfilment of certain specified conditions.

Chartered Accountant—A person who holds the certificate of the Institute of Chartered Accountants.

Chartered Bank—A bank trading under a special charter from the Crown.

Chartered Company—A company authorised to trade by Royal charter or by special Act of Parliament.

Charter-party—An agreement whereby a ship or part thereof is hired for a certain time or number of voyages.

Charters—Short for Charter-party.

Cheap Money—A term used when the demand for money is small and the supply large, the current rates for discount being consequently low.

Cheque to Bearer—A cheque that does not need endorsing.

Cheque to Order—A cheque that must be endorsed with the payee's signature.

Cie.—Abbreviated form of French *compagnie*, company.

c.i.f.—Cost, insurance, and freight. Pronounced as a word Cif, with the C as in city.

c.i.f.c. & i.—Cost, insurance, freight, commission, and interest.

Cipher Code—A code of figures, each figure or group of figures representing a phrase or sentence.

Circular Note—A letter of credit on foreign firms, issued to a traveller by a banker, so that the traveller does not have to carry large sums in coin or notes. Also called Circular Letter of Credit.

Circulation of a Bank—The amount of notes payable to bearer which a Bank of Issue is allowed to circulate.

Clean—The term used in describing a mate's or wharfinger's receipt, or a bill of lading, when it bears no detrimental clause, such as "Cases Broken." When bearing such clauses the document is "Dirty" or "Foul."

Clean Bill—See Bill of Health.

Clear Days—Days exclusive of those on which a transaction is begun or ended.

Clearance—See Ship's Clearance.

Clearers—Bank clerks who attend the Bankers' Clearing House.

Clearing Ships—Fulfilling all the Customs formalities on the arrival or departure of a vessel. Ships arriving are "cleared inwards," and ships departing are "cleared outwards."

Cloff—An allowance for the weight of the wrapper in bale goods.

Closing Prices—The quotations for stocks and shares, according to the day's last sales.

c/m—Call of more.

C N—Credit Note.
c/o—Care of; carried over (bookkeeping).
C/O—Cash order.
Cocket—A Custom House warrant issued on the entry of goods for export, indicating that they have paid the duty.
C.O.D.—Cash on delivery.
Collateral Security.—A secondary security in addition to that already given.
Com.—Commission.
Commercial Bills—Bills of exchange.
Commission Agents—Agents who undertake buying and selling for others, receiving as remuneration an agreed commission. They usually sell in their own name, and have the goods they sell in their possession. Also called Factors.
Committee of Directors—A small body elected for a special purpose from their own number by a board of directors.
Company Promoter—One who organises and brings out a public company, paying the preliminary expenses.
Composition—Part payment by agreement of a bankrupt or insolvent in settlement of his debts.
Compound Options—See Call of More, Put and Call, Put of More.
Compounding—Making an agreement with creditors for a composition in return for a full discharge of indebtedness.
Compte rendu—French. Account rendered.
Confirmation Note—A slip usually attached by perforations to an order or contract, which the party can sign, detach, and post to the sender as confirmation of the receipt of the order.
Consideration—The reason demanded in law for the passing of any property from one person to another.
Consideration Money — The amount named in a transfer of stock as paid to the ultimate vendor. It often differs from the amount paid to the original seller, as his buyer may make a subsequent sale.
Consignment Note—A printed form requesting a railway company to receive and forward a consignment of goods.
Consolidated—A term used in describing funds which have been consolidated into one common debt.
Consols—Short for Consolidated Funds. Government securities of Great Britain, comprising a large part of the National Debt.
Consul—An officer appointed by the Government of a State to protect its commercial interests in a foreign country.
Consulage—The fees paid to a consul for his seal and signature to a document.
Consular Invoice—An invoice certified or visèd by the consul of the country to which the goods are going.
Contango—The additional rate of interest charged for carrying over a "bull" transaction till the next settlement day.
Contango Day—See Settlement.
Continuation—Carrying over transactions from one settling day to another.
Contra—A bookkeeping term meaning on the opposite side. In a cash-book, contra is the credit side.
Contract—A binding agreement between two or more persons.
Contract Note—A document setting forth the terms and conditions of a purchase or sale.
Convertible Paper Currency—Paper money which can be exchanged, on demand, at the Government bank, for coins to their face value.
Convertible Securities—Securities that can be easily converted into money.
Cooperage—Money charged by a dock company for mending, opening, or closing barrels.
Cordage—A term for all kinds of rope, cord, ships' rigging, etc.
Corner—To buy up securities or goods in such a quantity as to control the market. Also called Bear Squeeze and Rig.
Cost and Freight—Prices quoted C and F include cost and the charges for freight, etc., but the buyer must arrange and pay for the marine insurance.
Cost, Freight, and Insurance—Prices quoted C.F.I. or C.I.F. include the cost of goods, and all freight and marine insurance charges.
Counterfoil—The part of a document permanently kept in a book after the other part has been torn out. The counterfoil has duplicate particulars written upon it.
Country Notes—Banknotes issued by any Bank of Issue other than the Bank of England.
Coupon—A note or warrant for interest or dividend attached to transferable bonds for the purpose of being detached and presented for payment when such interest or dividend falls due.
Coupon Sheet—A connected series of coupons, which may be separated and presented for payment as they fall due.
Course of Exchange—See Rate of Exchange.
Cover—Cash or securities held by a broker to cover the risk of loss in transactions on behalf of a client.
Covering Note—A form issued by marine insurance companies as an interim policy while the formal policy is being prepared. Lloyd's underwriters call it a "slip.
C.P.—Carriage paid.
C P—Charter party.
Cr.—Credit or creditor.
Cranage—The charge for the use of a crane in loading or unloading a ship.
Credit Note.—A form similar to an invoice, but usually printed in red, showing the amount credited to a buyer for goods returned damaged, or for some similar allowance.
Credit Slip—Same as Paying-in-Slip.
Cross Exchange—An exchange made in London between two foreign places direct, as between Paris and Petrograd.
c/s—Cases.
Cum Dividend—With the dividend. A term used when the buyer of stocks or shares takes the dividend about to be paid. Also written Cum Div. See Ex. Div.
Cum. Pref.—Cumulative Preference.
Current—The present time; so that a price current is a price obtaining at the time it is quoted.
Customs Declaration—A form to be filled up when goods are sent out of the country, declaring their nature, value, and weight.
Customs Duties—Taxes levied upon the importation or exportation of merchandise.
Customs Entry—A form with full particulars of goods to be landed or shipped, which is given to the Customs officials.
Cutting—The lowering of prices beyond what is required by ordinary competition.
C.W.O.—Cash with order.

D/A—Deposit account (banking); discharge afloat (chartering).
D/a—Days after acceptance.
Dandy Note—An order from the Custom House to the warehouse officer requesting him to deliver to the searcher certain bonded goods required for exportation or ship's stores. See Pricking Note.
Dating Forward—Dating an invoice later than the time when the goods are delivered.
Days of Grace—The number of days which expire after the day stated in a bill of exchange as that on which payment is due, before such payment can be legally demanded. In the United Kingdom three days are allowed, except for bills payable on demand or at sight.
Days' Sight—Days counting after a bill of exchange has been accepted.
Day to Day Loan, Day to Day Money—Money borrowed from day to day against security at a fixed rate of interest.
D.B. Day-book.
Dbk.—Drawback.
D/C—Deviation clause.
D/D—Demand draft; days after date.
D/d—Delivered.
d/d—Days' date.
Dead Account—In bookkeeping, a term used for impersonal accounts, such as petty cash, goods account, etc. In banking, securities standing to the credit of a deceased person.
Dead Freight—When a shipper is unable for any reason to ship goods for which he has engaged room in a vessel, the owners can charge him for the freight such goods would have incurred, and this is called dead freight.
Dead Loans—Loans not paid at the time agreed, or for which no specified time is named.
Dead Security—Properties, such as collieries, mills, etc., which are worth nothing as security unless worked.
Dead Weight—Heavy goods which pay freight according to weight, and are usually placed in the bottom of a vessel to steady her.
Dead Work—Any unproductive work, such as erecting works, pumping water from a mine, which must be done before a profit can be made.
Dear Money—See Cheap Money.
Deb.—Debenture. See page 2985
Debit—To charge a person with some expense incurred on his behalf; to make an entry on the Dr. side of an account.
Debit Note—A form used when anyone debits another for goods returned, or for any charge made on them.
Debt of Honour—A debt for which there is no written proof.
Dec.—Decrease.
Declaration of Association—A form of words at the end of a memorandum of association in which certain persons declare their desire to be formed into a company, and agree to take shares.
Deed—A written contract which has afterwards been sealed and delivered.
Deed of Arrangement—An arrangement made by deed by an insolvent debtor for the benefit of his creditors.
Deed of Assignment—A deed made by an insolvent debtor giving up for the benefit of his creditors the whole of his property for realisation.
Deed of Inspectorship—A deed made by an insolvent trader handing his business over to creditors, who appoint trustees called inspectors to carry on or wind up.
De facto—Actually.
Def.—Deferred.
Deferred Bonds—Bonds bearing a gradually increasing interest until this reaches a fixed specified rate.
Deferred Stock—Also called "A" stock. Part of the ordinary stock of a railway that is not entitled to dividend until a fixed rate has been paid on preferred or "B" stock.
Deficiency—An allowance made by the Customs for loss on wines and spirits. If the loss is natural, as by absorption, evaporation, etc., the allowance is "Ordinary"; if through defective staves, worm-holes, slack hoops, or some such cause, it is "Special."

De jure—By right.

Del Credere—An engagement entered into by an agent, guaranteeing that all goods which he sells shall be paid for. For this he gets an extra commission, known as a Del Credere commission.

Delivery Order—A document, which must bear a penny stamp, sent by the owner of goods lying in a wharf or warehouse, requesting the person in charge to deliver the whole or part of them to the bearer.

Demand Draft—A draft payable on demand.

Demurrage—A charge per day made by the owner of a vessel as compensation for its detention beyond a specified time. Railway companies make a similar charge for the detention of trucks.

Dependencies—Assets likely to accrue, but the amount of which cannot be determined in advance.

Depreciation—A term used in bookkeeping when an allowance is made for wear and tear of machinery, tools, buildings, etc. This is usually fixed by a percentage of annual shrinkage in value, and is written off periodically.

Despatch Note—A document filled in and handed to the Post Office when a parcel is sent abroad by post.

Deviation—A marine insurance term for a departure from the terms of a policy which discharges the underwriter's risk.

Dies Non—A day on which for some reason business cannot be conducted.

Differences—The amounts paid by or to a speculator who does not take up the stock he buys. The differences are those between the buying and selling prices.

Direct Exchange—An operation of exchange between two countries based on their own rate of exchange, without the interposition of a third country.

Dirty Receipt—See Clean.

Dis.—Discount.

Discharge—To discharge a bill is to pay it.

Discharged Bankrupt—One who has received his certificate of discharge from the Bankruptcy Court.

Dishonouring a Bill—A drawee refusing to accept a bill, or an acceptor failing to pay it when due.

Dispatch Money—An allowance of so much per day or hour made by the owners of a chartered vessel when she is loaded or unloaded in less time than that specified on the charter-party.

Div.—Dividend.

Dividend—(a) Payment of a share of the profits to the shareholders of a limited company; (b) a payment of interest on the National Debt; (c) money paid out of a bankrupt's estate to creditors, and reckoned at so much in the £.

D/N—Debit note.

D/O—Delivery order.

Dock and Town Dues—Dues charged for the use of the dock and port; peculiar to Liverpool.

Dock Charges, Dock Dues—Tolls charged to vessels for the use of the docks, tackle, etc.

Dock Warrant—A warrant or receipt for goods in charge of a dock company, giving full particulars as to mark, weight, etc.

Dock Weight Note—See Weight Note.

Document Bills—A set of bills of exchange to which are attached shipping documents—the bill of lading, invoice, marine insurance policy, and letter of hypothecation.

Document Credit—A letter of credit issued on condition that certain specified securities shall be deposited as a collateral security.

Domiciled Bill—A bill of exchange the place of payment of which is inserted at the time of acceptance. The place, usually a bank, is the domicile.

Double Option—See Options.

D.R.—Deposit receipt.

Dr.—Debtor.

Draft—(a) A bill of exchange; (b) the first rough copy of a letter or document; (c) the number of feet a vessel sinks in the water; (d) an order by which money is drawn from a bank; (e) the allowance made by a wholesaler or manufacturer to a retailer for waste by evaporation, the turn of the scale, etc.

Drain of Bullion—The flowing away of a nation's reserve of gold and silver to such an extent as, if not stopped, will leave insufficient for the requirements of trade.

Draw—To fill up a document, such as a cheque, bill of exchange, etc. The one who does this is the drawer; the recipient who has to pay is the drawee.

Drawback—Customs or Excise dues already paid, refunded by the Government on certain classes of goods exported.

Dry Goods—Sometimes used to indicate tobacco, snuff, cigars, dyes, drugs, spices, tea, coffee, chicory, dried fruit, and similar goods; but in America it implies textile fabrics, including shawls, silk, thread, etc., as distinct from groceries.

D/S—Days' sight.

Dues—Charges made for the use of anything, as dock dues, harbour dues, etc.

Dunnage—Anything used to protect a ship's cargo during a voyage—mats, wood, etc.

D/W—Dock warrant.

d.w.—dead weight.

D/y—Delivery.

E & O E—Errors and omissions excepted.

Earnest, Earnest Money—A sum paid by a buyer to a seller to bind a verbal bargain.

E.E.—Errors excepted.

E.I.D.—East India Docks.

Embargo—A Government order prohibiting ships entering or leaving a port, or loading or unloading goods, often enforced in war time.

Emporium—A place where merchants store their goods; also a place for the importation and sale of merchandise.

Endorse—To write one's name on the back of a document, such as a cheque, bill of exchange, etc.

Enfaced Paper—Promissory notes of the Indian Government, so called because of a notification on their face that interest is payable in London by draft on Calcutta.

Entrepot—An intermediate port or warehouse for the temporary reception of merchandise in course of transit to another place.

Entry—To make an entry of goods or to pass Customs entry is to give the authorities full particulars of any merchandise exported or imported, and to pay any necessary duty.

Entry for Warehousing—A Customs document issued when dutiable goods are imported, but are going to be stored in a bonded or Government warehouse till wanted.

Entry Inwards—Customs entry of imported goods.

Entry Outwards—Customs entry of exported goods.

Errors and Omissions Excepted—A phrase, inserted in full or abbreviated thus, E & O E, in an account giving the seller the right to rectify omissions and errors subsequently discovered.

Errors Excepted (E.E.)—A term similar to the last, enabling errors in an account to be rectified.

Even—A Stock Exchange term. Securities are carried over "at even" when there is neither contango nor backwardation to pay.

Ex All—Without dividend, bonus, return of capital, or the right to claim new stocks or shares about to be issued.

Exchange Operation—The giving of one option against another, as, for instance, giving the "call" against taking the "put." See Options.

Exchequer Bills—Promissory notes issued by the Exchequer by Parliamentary authority, and representing the chief portion of the unfunded debt of the country.

Exchequer Bonds—Similar securities to Exchequer bills, but of a more permanent nature, as they run for a longer period.

Ex Cont.—From contract.

Ex Coupon—Without interest coupon.

Ex cp.—Ex coupon.

Ex d.—Ex dividend.

Ex Dividend—Without the dividend that is due or accuring.

Ex Interest—Without the interest due or accuring.

Ex New—Without the right to claim any new stocks or shares about to be issued.

Expected to Rank—The sum which, in a bankruptcy, is expected to be the actual amount owing.

Ex-Ship—A term which means that goods are sold free out of the ship, and the buyer must supply barges to receive the goods.

Ex-Store—Out of the store.

Ex-Warehouse—Out of the warehouse. Where goods are sold ex-warehouse, the buyer must provide his own conveyance to move them from the warehouse.

Ex-Wharf—Off the wharf.

F.A.A. or F.a.a.—Free of all average.

Face Value—The original value named on the face of a document, as distinct from its current market value.

Factor—Same as Commission Agent.

Factorage—A charge made by factors for conducting business for another.

Fair Average Sample—See Sample.

F.a.q.—Fair average quality.

F.a.s.—Free alongside ship.

F.c.s.—Free of capture and seizure.

F.D.—Free docks.

F.g.—Fully good.

F.g.a.—Foreign general average.

F.g.f.—Fully good, fair.

F.i.b.—Free into bunker (coal trade).

Fidelity Guarantees—Policies or bonds issued by guarantee societies, guaranteeing the fidelity of clerks, travellers, etc., and agreeing to make good any defalcations by them. Fixed annual payments are made for such bonds.

Fiduciary Loan—A loan granted to a person without security by a lender who trusts to the borrower's honour.

Fiduciary Note Issue—An issue of notes without any reserve of bullion to meet them.

Figure Code—A code made up of figures representing words and phrases.

Fine Bank Bills—Bills drawn on banks of the first class.

Fine Bills—Same as Fine Paper.

Fine Paper—Bills, drafts, etc., bearing the names of first-class houses and financiers as acceptors or endorsers. Second and third class paper have the name of persons of less standing.

Fine Trade Bills—Trade bills drawn on first-class houses.

First-class Paper—Same as Fine Paper.

First Cost—Same as Prime Cost.

First of Exchange—The first copy of a set of bills of exchange. The other copies are called second and third of exchange. See Foreign Bills of Exchange in Index.

F.i.t.—Free of income tax.
Fittage.—Commission or brokerage.
Fixed Capital—Capital employed in securing and providing land, buildings, machinery, etc., necessary for the making of profits.
Fixed Charges—The charges which a company must pay before dividing profits. Interest and rentals are fixed charges.
F.L.N.—Following landing numbers (marine insurance).
Floaters—Bills and securities held at "call."
Floating a Company—Forming and registering a company.
Floating Capital—The sum in hand and available at short notice for the carrying on of a business.
Floating Debt—Same as Unfunded Debt.
Floating Money—Money in the market available for loans.
Floating Policy—A policy insuring goods that are not all in one place or one ship. If when goods are insured, for instance, the name of the ship carrying them is not known, the policy covers any ship or ships for a specified sum; and as each vessel is fixed, its name and the amount apportioned to it are endorsed on the policy.
Flotsam—Goods found floating after shipwreck. See Jetsam and Lagan.
F.O.—Firm offer.
F/o—For orders.
F.o.b.—Free on board.
Fol.—Folio.
Folio—In bookkeeping, two pages facing each other and numbered alike.
F.o.r.—Free on rail.
Force Majeure—Circumstances over which human beings have no control.
Foreclose—To seize the property on which a mortgage is raised in the event of default or non-payment at the specified time.
Foreign General Average—A term in marine insurance meaning that the underwriters are to pay for any general average according to the average statement made abroad, should it be made there.
For Money—Dealings for money on the Stock Exchange are transactions paid for at the time.
For the Account—Stock Exchange transactions to be settled on the next half-monthly settling day.
Forward—A forward quotation is the price for delivery at a future time. See Spot.
F.o.s.—Free on steamer.
F.o.t.—Free on trucks.
Foul—See Clean.
Foul Bill—See Bill of Health.
F.o.w.—First open water (in chartering).
F.p.—Fully paid.
F.p.a.—Free of particular average.
Free Alongside Ship—A price quoted thus covers carriage and lighterage to alongside the ship, but the buyer must arrange for getting the goods on board.
Free of All Average—In marine insurance this means that goods are insured against total loss only, and that no claim can be made either for general or particular average.
Free of Capture and Seizure—A clause inserted in marine insurance policies in war-time by which underwriters cover themselves against this risk.
Free of Particular Average—Some goods are very susceptible to damage from sea-water, heat, rust, etc., and underwriters only insure such goods "free of particular average." They are not then liable for partial losses from such causes, unless the "ship, craft, or any conveyance, as the interest insured, be stranded, sunk, burnt, on fire, or in collision," when particular average can be claimed.
Free on Board—Prices quoted thus cover the carriage to a port and the charges of putting on board the vessel. The buyer must pay freight.
Free Overside—The same as Ex-ship.
Free Port—A port where no import or export duties are levied.
Freight—The charge made for carriage of goods by water; the money paid for the hire of a ship, barge, etc.; also a ship's cargo.
Freight Engagement—A statement written by the shipbrokers on the back of their shipping card, giving the tonnage engaged and the rate of freight and primage.
Freighter—The charterer of a vessel.
Freight Forward—Freight to be paid by the consignee when the goods arrive.
Freight Note—A debit note sent by the shipbroker to the shipper for the freight of goods shipped.
Freight Receipt—A receipted freight note.
Freight Release—An endorsement on the bill of lading authorising the officer in charge of the ship to deliver goods sent freight forward. It indicates that the freight has been paid.
Funding—The process by which a floating debt is converted into stock.
Frt.—Freight.
F.T.W.—Free Trade Wharf.
Funds—Usually Consols and other securities of the British Government. Also stock or capital, and money, the income of which is set apart for some specific object.
Futures—Goods to be shipped at some future time, as distinct from "spot" stocks and goods "on passage."

G—Gauge.
G.A. or **G/a**—General average.
Garble—Dross or refuse picked from spices, drugs, tobacco, etc., in sorting.
Garbling—Separating the bad or damaged portions of goods from the sound portions.
Garbling Coin—The practice of some money-dealers who separate full-weight coins from light and worn ones, passing the latter into circulation again and melting the former for the manufacture of jewellery or gold leaf.
Garnishee—A person who owes money to or holds the property of another who is a judgment debtor.
Garnishee Order—A notice sent to a person owing a judgment debtor money, or holding his goods, declaring he is not to part with such money or goods until the claim against the debtor is settled. This prevents the debtor obtaining the goods and using them for himself instead of for his creditors.
Garnishment—The notice sent to garnishees.
Gauger—An Excise or Customs officer who measures and examines vessels containing dutiable liquids.
Gauging Rod—The instrument used in measuring the contents of casks, barrels, etc.
General Acceptance—See Acceptance..
General Ship—A ship chartered, but not for any particular voyage or cargo.
Give On—To pay contango.
Giver—Same as Bull.
Glut—An over-supply of any commodity.
G.m.b.—Good merchantable brand.
G.m.q.—Good merchantable quality.
G.o.b.—Good ordinary brand.
Godown—A term used in the East for a warehouse, usually underground, where imported goods are stored till required.
Gold Bonds—Bonds payable in gold.
Gold Movements—Arrivals and shipments of gold bullion and coins.
Gold Premium—The rate by which the value of a paper currency is exceeded by that of gold which it represents.
Good Merchantable Quality and Condition—A phrase used in contracts, meaning that goods must be up to ordinary quality and condition.
Goods—Goods train.
Good Until Cancelled—This condition attached to an order to a stockbroker to buy or sell means that the order remains in force until countermanded. Often abbreviated to G.T.C.
Goodwill—The value of an established business connection, including all the advantages the existing owner possesses of carrying on the business.
Gr.—Gross.
Grace—See Days of Grace.
Grande Vitesse—French for fast goods train.
Graving—Cleaning a ship's bottom.
Great Gross—Twelve gross.
Great Hundred—120 articles.
Greenbacks—United States paper currency.
Gresham's Law—The declaration by Sir Thomas Gresham that: Where two sorts of coins are current in the same nation, of like value by denomination, but not intrinsically, that which has the least value will be current, and the other as much as possible hoarded or exported."
Gross—Twelve dozen. See Great Gross.
Groundage—A charge made in certain ports for allowing a ship to anchor there.
Ground Price—Continental term for basis price.
Gr. wt.—Gross weight.
G.T.C.—See Good Until Cancelled.
Guarantee Society—A society which issues fidelity guarantees, which see.

HAMMERED—When a member of the Stock Exchange finds himself unable to meet his engagements, the head waiter, as the porter is called, strikes three blows with a hammer on the rostrum in the "House" and announces the default. The member is thus said to be "hammered."
Handsel—Earnest money.
H. A. or D.—Havre, Antwerp, or Dunkirk. (Used in grain trade.)
Harbour Dues—Tolls paid by ships for the use of a harbour, with landing-stages, etc.
Harden—To advance in price. Used of stocks and shares.
Hatchway—Same as Hatches.
Hat Money—Same as Primage.
Haulage—A charge by a railway, dock, or canal company for carrying goods from place to place. It does not include loading or unloading.
H.B.C.—Hudson's Bay Company.
H.C.—Held covered (by insurance).
Heavies—Same as Heavy Stock.
Heavy Stock—The stock of railway companies having a heavy goods traffic.
Heritable Bonds—Bonds with a conveyance of land attached, given as security for the repayment of money. If the bond is not honoured or the interest paid, the conveyance becomes available.
H H—Havre and Hamburg. (Used in grain trade.)
Hhd.—Hogshead.
High Seas—All seas except those within three miles of countries with a seaboard. The seas in the three-mile limit are called territorial waters or mare clausum (Latin for closed sea).
H.M.C.—His Majesty's Customs.
Hold—The hollow part of a ship in which the cargo is placed.
Holder—The person in possession of a bill of exchange or other document.
Holding the Market—Preventing a decline in the price of a security by buying it as it is offered.

Home Use Entry—A Customs document used when dutiable goods are to be taken from a warehouse for home consumption.

Hong—The name given by the natives to any European factory in China.

Hong Name—A brand mark in Chinese characters used by merchants in China to distinguish their own particular goods.

Housing—Warehousing.

Hypothec—In Scotland, a lien given to a creditor upon the property of his debtor, possession remaining with the debtor.

Hypothecation—The giving of a lien upon property or the pledging of documents conveying right thereto, while still retaining possession of the property; contrasted with pawning, where the property is handed over to the creditor.

Hypothecation Bond—A bottomry bond or respondentia bond.

I.B.—Invoice book.

I.B.I.—Invoice book inwards.

I.B.O.—Invoice book outwards.

Impersonal Accounts—Accounts dealing not with persons, but with things, such as petty cash, charges, etc.

Imposts—Taxes levied on merchandise, particularly on imports.

Impressed Stamp—A stamp not stuck on, but impressed on a document in payment of stamp duty.

In Ballast—A vessel is said to be in ballast when she has no cargo, but carries ballast, such as gravel, flints, stones, etc., to keep her steady in the water.

In Clearers—Bank clerks who attend the Bankers' Clearing House and receive all cheques drawn upon their banks. See Out Clearers.

Inconvertible Paper Currency—Paper money which cannot be exchanged for coinage on demand.

Indemnity—Compensation for losses or injury. See also Letter of Indemnity.

Indent—Originally an order sent to a merchant by his clients abroad for some particular brand of goods, the manufacturer and price of which are specified. Now, however, any order from abroad for the purchase of goods is spoken of as an indent.

Indentures—Written agreements between parties, each of whom retains a copy.

Indirect Exchange—Exchange operations between two countries, through the medium of one or more other countries.

Indorse—See Endorse.

Inland Bill—A bill of exchange drawn by one person or firm on another within the British Isles.

Inscribed Stock—Stock for which certificates are not issued to the holders, but their names and holdings are entered in a register at the bank where the stock was issued.

Inside Broker—A broker who is a member of the Stock Exchange.

Inspecting Order—An order to a dock company or wharfinger to allow the bearer to inspect and sample goods lying at the dock or wharf.

Inst.—Instant; meaning "of the current month."

Int.—Interest.

Interbourse Securities—Securities the loans for which were raised simultaneously in different countries.

Interdict—An interdict at port of discharge is a clause in a bill of lading forbidding entry of a port.

Interest Policy—In marine insurance, a policy in which some real and specified interest is insured, as 100 boxes of oranges.

Interest Warrant—An order for the payment of dividends on public stocks.

Interim Dividend—A provisional distribution of profits, before the actual dividend is due, or before the complete profits for the year are known.

In Transitu—In course of transmission.

Inv.—Invoice.

Inventory—A list of goods, fixtures, etc., made either for reference or for a sale.

Invoice Book—A book containing copies of original invoices.

I.R.O.—Inland Revenue Office.

Issue Par—The price at which a security is first sold, irrespective of its actual face value.

Issue Price—The price at which an issue of securities is offered to the public.

J/a—Joint account.

Jerquer—A Customs official who searches vessels for smuggled goods that should pay duty.

Jerquing—The searching of a ship by a jerquer.

Jetsam—In marine insurance, goods which, to lighten a ship, have been thrown overboard and sunk, and which remain under water. See Flotsam and Lagan.

Jettison—To lighten a ship by throwing overboard cargo or tackle.

Job—To deal in merchandise on one's own account, and not as an agent or broker.

Jobber—One who jobs in any article. In a more restricted sense a jobber is a stock dealer who carries on business with the public and other jobbers through stockbrokers.

Joint Account—Two or more firms trade upon joint account when the profits or losses which each makes are equally divided among all.

Joint Stock—Stock which is held jointly by a number of persons.

Joint-stock Bank—A joint-stock company carrying on the business of a bank.

Joint-stock Company—An association of individuals for purposes of profit, possessing a common capital contributed by the members composing it, such capital being divided into shares, of which each possesses one or more, and which are transferable.

Judge's Order—An order made by a judge in an action to recover a debt, by which proceedings are stayed upon the debtor undertaking to pay the debt and costs within a specified time.

Judgment Debtor—One who is ordered to pay his creditor by a court of law.

KEELAGE—Tolls charged to a ship for entering and resting in certain ports and harbours.

Kentledge—Ballast for a ship, consisting of iron castings known as "pigs."

Kite—See Accommodation Bill.

Kite-flying—Dealing in accommodation bills so as to raise money to maintain one's credit.

Knot—A nautical mile of 6080 feet.

£—Pounds sterling, placed before the figure, £20.

l—Pounds sterling, placed after the figure, 20*l*.

l/a—Lettre d'avis, letter of advice.

Lac—100,000, as in lac of rupees. Also spelt lakh.

Laches—In commercial law, an act of negligence or carelessness entailing inconvenience or loss to the person committing it. An example is a banker paying a cheque which a little care would have shown to be forged.

Laden in Bulk—The term used when a ship's cargo is filled loose into the hold, but properly dunnaged to prevent loss.

Lagan—Heavy goods cast into the sea by jettison, which sink, but have a cork or buoy attached so that they may be found again. See Flotsam and Jetsam.

Lakh—See Lac.

Lame Duck—A Stock Exchange term for a defaulter.

Land Carriage—Conveyance of goods by road or rail.

Landing Account—A dock company's account of goods landed, with full particulars of weight and condition.

Landing Book—A book kept by dock companies and warehouse keepers, in which are entered full details of all goods landed, and from which landing accounts are made out.

Landing Order—A Customs document handed to the chief officer of a ship, authorising him to allow goods to be landed, the importer having passed entry and paid any duty that is due.

Landing Waiter—See Land Waiter.

Landing Weight—The actual weight of goods as landed from a ship.

Land Waiter—A Customs official who examines, weighs, measures, tastes, etc., goods liable to duty and makes a record in a book. In the case of goods exported he certifies that they are shipped according to prescribed form.

Lastage—Sand or ballast placed in a ship to keep her steady.

Law of Merchants—See Lex Mercatorum.

Lay Days—Days allowed for loading or unloading ships as agreed upon between owners and charterers. Lay days begin directly permission to load or unload is given.

Laying Days—Same as Lay Days.

Lazaretto—A building or ship where goods, letters, baggage, etc., from ships in quarantine are fumigated.

lb.—pound (weight); the plural is lb., not lbs.

L/C—Letter of credit.

L.D.—London Docks.

Ld.—Limited.

£E—Egyptian pounds (£1 0s. 6¼d. sterling).

Leakage—An allowance made for loss or waste in liquids.

Led—Ledger.

Legal Quay—A wharf licensed by the Customs authorities for the landing and storage of bonded goods.

Legal Tender—The authorised coins that may be legally tendered in payment of debts. In the United Kingdom they are gold up to any amount, silver up to two pounds, pence and halfpence up to a shilling, and farthings up to 6d. Bank of England notes are also legal tender up to any amount, but not exceeding the debt, as no one but the Bank itself is obliged to give change for a note.

Legan—See Lagan, of which it is only another spelling.

Letter of Allotment—The formal document sent to an applicant for shares in a public company, stating the number of shares allotted to him. If under the nominal value of £5, the stamp duty is one penny; if over £5, sixpence.

Letter of Attorney—See Power of Attorney.

Letter of Credit—A letter given by a banker or merchant authorising his agents to pay money to the bearer.

Letter of Hypothecation—A formal letter giving a person a lien over goods in consideration of an advance of money. See also Hypothecation.

Letter of Indemnity—A letter from a manufacturer to a merchant, guaranteeing the latter against loss or claim through goods having been shipped not in good order and condition, or through the number of packages being disputed.

Letter of Indication—A letter issued with a circular note, describing the bearer and giving a copy of his signature. It must be produced when the note is presented for payment.

Letter of Licence—A document signed by the creditors of a person insolvent or in difficulties, allowing his business to be carried on for a specified time without payment of their claims.

Letter of Marque—A Government licence granted in time of war, authorising merchants to fit out privateers to prey upon the enemy.

Letter of Renunciation—A letter sometimes sent with a letter of allotment, giving the allottee the right to renounce the shares allotted to him. He exercises the right by signing the letter of renunciation.

Letters Patent—An open writing sealed with the Great Seal of England, giving a person the sole right for a certain number of years of making use of an invention of which he is the author. The invention is then a patent.

Lettre de Change—French for bill of exchange.

Lettre de Créance—French for letter of credit.

Lex Mercatorum—Called the Lex Mercatoria and the Law of Merchants. The usages and customs that regulate commercial matters among civilised peoples.

Levant—The coasts of the Mediterranean east of Italy.

L.H.A.R.—London, Havre, Antwerp, Rouen (grain trade).

Lien—A legal right of claim upon goods, etc., usually granted as security for debt.

Lien Maritime—A lien applying to ships freight, or cargo, and arising by law or by special contract. Seamen have a lien on a ship for their wages.

Light Dues—Tolls levied by the Custom House on ships for the maintenance of beacons, buoys, lighthouses, etc.

Light Gold—Gold coins that have become light in weight through wear or other causes.

Lighterage—The charge made by lightermen for the use of their lighters or barges when conveying goods for others.

Limit—A price fixed at which a purchase or sale is to be made. See Low Limited.

Limitations, Statute of—The time within which action must be taken where an injury has been done or a debt incurred. For most commercial transactions this is six years, as for debts, arrears of rent, actions for trespass, the negotiation of bills or notes, bank balances and deposits.

Limited and Reduced—A limited company whose capital has been reduced from its original amount.

Limited Company—Short for Limited Liability Company; a public company in which the shareholders cannot be called upon to subscribe more than the nominal value of the shares held by them.

Liquid Assets—A bankers' term for coin, banknotes, and securities which can be converted at once into cash.

Liquidated Damages—Damages, as in a charter party clause, the amount of which has been agreed upon.

Liquidation—The winding up of a business. A public company in course of being wound up is said to be "in liquidation."

Lloyd's Bonds—Promissory notes, bearing interest payable to bearer, issued to evade the Mortgage Debenture Act, which prohibits a company borrowing more than a sum equal to two-thirds its paid-up capital. Named after their originator, a barrister named Lloyd. Lloyd's bond is also the term used for a form of agreement authorised by the Committee of Lloyd's protecting shipowners from losses already suffered by a ship. It differs from a policy, which is issued before a ship sails.

Lloyd's Policy—The form of policy authorised by the Committee of Lloyd's.

Loan Rate—A money-market term for the rate of interest paid for money advanced against a deposit of securities.

Lockage—Dues paid for passing boats through locks.

Locker's Orders—Forms in which can be set forth particulars of goods to be exported, printed on the back of bond notes.

Log Book—A book in which the captain keeps a daily record of his ship's voyage, the winds, weather, course.

Lombard Street—A newspaper term for the open money market.

Long—An American Stock Exchange term similar to the English "bull." The person who holds stock for a rise is said to be "long of stock."

Long Bill—A bill of exchange having a long term to run.

Long-Dated Bill—Same as Long Bill.

Long Dozen—Thirteen articles reckoned as twelve.

Long Hundred—120 articles.

Lot—A portion, pile, or parcel of goods set apart for a purpose, as for shipment or sale.

Lot Money—An auctioneer's commission of so much for each lot sold by him at an auction.

Low Limited—A limit that is unworkable and is therefore referred back. See Limit.

L.S.—Locus sigilli, the place for the seal on a document.

£ s. d.—Pounds, shillings, pence; from Latin: libræ, solidi, denarii.

£T—Turkish pounds.

Ltd.—Limited.

M.—Monsieur.

M or m—Thousand, as 200m = 200,000.

Made Bill—A bill with the name of a third party upon it in the form of one or more endorsers.

Mail Steamer—A steamer chartered to carry the royal mails.

Making-Up Day—See Settlement.

Making-Up Price—Stock Exchange term for the price at which stocks and shares are closed for the settlement and reopened for the next account.

Manifest—A statement made out by the captain of a ship before sailing, giving full details of the cargo, with marks, weights, consignees, etc., particulars of the ship and crew, and her ports of destination. This is lodged at the Custom House before leaving or when entering a port. A copy can usually be seen at the shipbroker's office.

Margin—(1) Cash or securities required by a banker over the amount of money lent, to provide against depreciation of the securities deposited with him. (2) Another name for "Cover," which see. (3) A discretion of so much per cent. or per share allowed to a broker over a named price, if business should be impossible at the figure fixed.

Mariners—In shipping documents, the sailors and officers outside the captain and pilot.

Maritime Law—The branch of commercial law relating to ports, harbours, ships, seamen, pilots, navigation, lighthouses, buoys, etc.

Marked Cheque—A cheque marked by the bank on which it is drawn, as good for the amount named on it.

Marked Transfer—Same as Certified Transfer.

Market Days—The fixed days when certain Exchanges like the Coal Exchange, the Corn Exchange, etc., are open.

Market Price—The current price at which goods are being bought and sold in the market.

Market Rate of Discount—The rate charged by bankers and billbrokers for discounting bills of exchange.

Market Report—A report describing the condition of the market, the prices ruling, etc., sent to merchants and traders on market days.

Market Value—The sum that can be obtained for goods or securities in the open market.

Marking—Posting up on the marking-board at the London Stock Exchange the prices at which a bargain or transaction between members has been effected. Such postings are called markings.

Mart—A contracted form of market.

Martinmas—November 11, one of the Scottish quarter-days.

Master—The captain or navigator of a ship.

Master's Copy—See Captain's Copy.

Mate's Receipt—The receipt signed by the mate for goods received on board ship. It is afterwards exchanged for the bill of lading.

Mature—A bill matures when it becomes due.

Maturity—The date when bills, drafts, etc., become due.

M/C—Metalling clause (marine insurance); marginal credit (banking).

M.D.—Millwall Docks (London).

M/d—Months' date: that is, months after date.

Measurement Account—See Measurement Goods.

Measurement Goods—Goods on which, owing to their light weight and great measurement, freight is charged by measurement instead of by weight. Forty cubic feet are reckoned as a ton. The account taken by the dock company and shipbroker for such goods, showing length, breadth, and depth of the cases, is called the measurement account.

Memorandum of Association — A stamped document setting forth the objects, capital, etc., of a limited liability company.

Metalling Clause—In marine insurance, a clause specifying that no claim can be made on the underwriters for ordinary wear and tear to a steamer below the water-line. The clause usually reads: "Warranted free from particular average below the load water-line, unless occasioned by fire or contact with some substance other than water."

Metric System—The system of weights and measures, now adopted in most countries, founded on decimals.

M.H.—Main hatch (shipping).

Michs.—Michaelmas.

Middle Price—The central price between those at which a dealer is willing to buy and sell.

Mint-par of Exchange—The intrinsic value of the unit of currency of one country as compared with the intrinsic value of the money in the currency of another country, determined by the weight and fineness of the coinage in the two countries.

Minute Book—A book in which are entered the minutes of the meetings of a pubc company or its directors.

Minutes—The gist of the proceedings at a company or directors' meeting, together with particulars of all resolutions. See page 2088.

M.I.P.—Marine Insurance Policy.

Mixed Currency—A currency consisting partly of the precious metals and partly of paper, both being legal tender.

Mixed Policy—In marine insurance, a policy insuring a ship from one place to another for a given period, making it both a voyage and a time policy.

Mks.—Marks (German coin).

M/m—Made merchantable (see Merchantable).

MM.—Messieurs, gentlemen, sirs.

Mo.—Month.

M.O.—Money Order.

Money Market—A general term for money transactions of all kinds, such as the dealings of bankers, bill-brokers, capitalists, money-changers,

Mono-metallism—A money currency based on a single standard of value, as in England, where gold is the only standard coin. Silver and bronze coins are merely token money, which see.

Monopoly Contract—A contract whereby a merchant buys up some manufacture, the manufacturer agreeing not to sell to others in the same market.

Month—In a bill of exchange, a calendar month; a half month is fifteen days.

M.O.O.—Money-order office.

Moratorium—An extension of time for the payment of debts, granted by a Government in exceptional circumstances, such as the Great War.

Mortgage—The pledging of property as security for debt. If the interest is not paid, the lender may seize the property.

Mos.—Months.

M.R.—Mate's receipt.

M.S.—Mail steamer.

M/s—Months' sight: that is, months after sight.

M.S.C.—Manchester Ship Canal.

M/u—Making up (Stock Exchange settlement).

Multiple Telegrams—Telegrams with identical wording sent to several persons in the same place or to one person at several addresses in the same place.

Muster—A sample. To "pass muster" means that the bulk is equal to the sample.

Muster Roll—A list of persons, passengers and crew, on a ship, with particulars as to name, address, age, sex, profession, etc., of each.

Mutuum—In mercantile law, something lent, with or without interest, in such a way as to imply an exchange for something equivalent.

N/A—No advice (banking).

N/a—Non-acceptance.

Name Day—The second day of the settlement on the London Stock Exchange. Same as Ticket Day.

Named Policy—A marine insurance policy in which the vessel's name is inserted at the time the insurance is made.

Navy Bills—These are of two kinds: (1) Bills issued by the Admiralty in payment of stores supplied to Government ships or dockyards; and (2) Short-dated bills drawn by naval officers on the Accountant-General for pay due.

N.C.—New charter; new crop; new account (Stock Exchange).

N/e—No effects.

Negotiable Document—A document which, when transferred, carries with it the legal right to the property specified therein.

Negotiable Instruments — Documents that are transferable by endorsement and delivery from one person to another, such as bills of exchange, promissory notes, etc.

Negotiable Paper—Same as Negotiable Instruments.

N/f—No funds.

N/m—No mark.

N/O—No orders (banking).

Nom.—Nominal.

Nos.—Numbers.

No Funds—A phrase endorsed by a banker on a cheque, the drawer of which has no funds to meet it, before returning the cheque to the person who paid it in.

Nominal Partner—A person with no real interest in a business that is carried on in his name, with his consent, as, for example, where a change of name might injure the reputation of a concern.

Nominal Price—An approximate price, given where the exact price can only be known after the transaction is completed.

Notary Public—An official authorised to attest, copy, or translate written documents. It is also the notary's duty to present for the second time dishonoured or non-accepted bills, protesting against and noting the dishonouring.

Note of Hand—A promissory note.

Notice of Dishonour—Notice that must be given by the holder of a bill to those who drew it or negotiated it, when the bill is dishonoured. See Dishonouring a Bill.

Noting a Bill—When a bill of exchange is returned dishonoured, the holder takes it to a notary public, who again presents the bill to the drawee. If it is not then accepted or paid, the notary makes a minute in his protest book of the answer given, writes on the bill his initials, the date, and his charges, and on a slip of paper the reason for non-acceptance. This is noting the bill.

Not Negotiable—An endorsement on a cheque which means that "the receiver shall not have, and shall not be capable of giving, a better title to it than that which the person from whom he took it had."

N/p—Non-payment.

N.P.—Notary public.

N.R.—No risk (insurance).

N/S or n/s—Not sufficient (banking).

N/t—New terms (grain trade).

Nursing an Account—If a banker who has made an advance on an unmarketable security finds that should he call up the loan the party would break, and the bank be the loser, he will often, instead of realising the security at once, lock it up, in the hope of selling it better later on, or in the hope that the borrower will be able to redeem his pledge. This is called "nursing the account."

O/a—On account of.

Obligation—A bond that contains a penalty and has a condition attached for the performing of a covenant, payment of money, etc.

Obs.—Obligations.

Obscuration—A Customs term for the difference between the strength of spirit indicated by the hydrometer and the true or actual strength.

O/c—Old charter; old crop; overcharge.

Octroi—A tax levied at the gates on goods brought into a city.

O/d—On demand.

O.D.O.—Outdoor officer (Customs).

Official Minimum—A term used for the current Bank rate.

Official Receiver—An official appointed by the Bankruptcy Court to manage the estate of an insolvent person during the liquidation of his affairs.

Omnium—The total value of the various kinds of stock forming a loan.

On 'Change—Members of the various Exchanges are said to go "on 'Change" when they attend a meeting at the Exchange. Stock Exchange members, however, are said to "go down to the House."

On Demand—A term used on a bill of exchange that is payable on presentation, and does not need to be accepted.

One and One—One month's prompt cast with 1 per cent. discount.

On the Berth—A vessel is "on the berth" when she is at the place where she loads or discharges her cargo.

Onus Probandi—The burden of proving —a term used in law.

%—Per cent.

‰—Per thousand.

Open Account—In bookkeeping, an unsettled account.

Open Credit—A term used when a letter of credit contains an unconditional request to pay money to a person.

Open Policy—In marine insurance, a policy in which, at the time the insurance is effected, it is stated that the interest is to be hereafter declared. This kind of policy is issued when the value of a cargo cannot be exactly fixed, and a sum is estimated and afterwards adjusted.

Option—The right of choice to buy anything during a specified time.

Option Money—Money paid to secure an option.

Options—A method of Stock Exchange speculation, a person paying down so much per cent. or per share for the option or right to "call"—that is, to buy—so much stock at a fixed price on a certain day, or for the right to "put"—that is, to sell—in the same way. Either case is called a "single option." The right to "put and call" is called a "double option." The right to put a certain amount of stock, with the option of doubling it, is called "put of more."

Ord.—Ordinary stock or shares.

Original Bill—A money-market term for a bill drawn and sold prior to having any endorsement.

Or Order—Bills of lading, delivery orders, etc., are made out to So-and-so, "or order," and this means that the goods will be delivered to him upon his endorsement, or he may endorse them over to another by naming the party in the endorsement.

Out Clearers—Bank clerks who receive cheques and arrange them alphabetically according to the banks on which they are drawn, ready for the In Clearers, which see.

Outport—Any port in the kingdom away from the main Custom House at London.

Outside Brokers—Stockbrokers who are not members of the Stock Exchange.

Over-capitalised—A company is over-capitalised when it is unable to earn sufficient profits to pay adequate interest on the shares issued.

Overhead Price—Same as All-round Price.

Over-insurance—A marine insurance term for when the value of the goods amounts to less than the sum insured. The difference is called short interest.

Over-takers—Extra packages used when goods bulked by the Customs cannot be completely replaced in the original packages.

Over-tonnage—The excess of ships over the freight available.

Over-trading—Trading beyond the capital available.

P.—Per or page.

P/A—Power of attorney; private account.

P.A.—Particular average (marine insurance).

Packing—The charge made for packing goods.

Paid-up Capital—The amount of capital paid on shares that are not fully paid up.

Paid-up Shares—Shares on which all that has to be paid is already paid up.

P. & L.—Profit and loss.

Par—A term used when the price of a security is the same as its nominal value. See "Above Par" and "Below Par." Also, when the money of two countries is equal is value, the exchange is said to be at par.

Parole—A word used to describe verbal arrangements, as an agreement made by parole.

Parquet—The sixty official brokers or Agents de Change on the Paris Bourse.

Partial Loss—Damage sustained by a ship or cargo during a voyage, for which the underwriters are liable to the owners. The policy, however, always has a clause declaring that the underwriters will not be responsible for partial loss when it does not amount to a percentage named. This is to prevent continuous, trifling demands.

Part Owners—Private shareholders of ships.

Par Value—The face value of securities.

Pass-book—A book given by a bank to a customer, showing all moneys received and paid. It is actually a copy of the customer's ledger account at the bank.

Passing a Name—A Stock Exchange term for giving the name of the actual purchaser at the settlement.

Passive Bonds—Bonds that do not bear interest, but entitle the holder to some future benefit or claim.

Patent—See Letters Patent.

Patentee—A person who owns a patent.

Pay Day—The last day of the Stock Exchange settlement, when shares are taken up and paid for, or differences settled. Also called settling day.

Paying-in-Slip — The memorandum handed to a bank with notes, bills, cheques, cash, etc., showing how much of each and the total amount paid in at the time.

P/C—Petty cash; price current.

p.c.—Per cent.

pc.—Piece or price.

P.C.B.—Petty-cash book.

pcs—Pieces or prices.

Penalty Clause—A clause in a contract imposing a penalty on the seller in case of the non-fulfilment of conditions specified.

Per Contra—A bookkeeping term, meaning "on the other side."

Per Diem—By the day.

Perils of the Sea—In shipping documents, the ordinary perils of a voyage.

Per Mille—Per thousand, written %o.

Permit—A permission granted by the Customs for the removal of goods on which duty has been paid; or a licence from the Excise allowing excisable goods to be moved from one place to another.

Per Pro.—See Per Procuration.

Per Procuration—A procuration is a written document empowering a person to act and sign for another. When so signing, the term is placed in front of the signature, abbreviated to per pro., p.p., or p. pro.

Personal Accounts—In bookkeeping, the accounts of persons set forth under their names.

Personal Estate—Money, goods, debts and rents due, leasehold property, furniture, insurance policies, stocks, shares, etc.

Personal Security—A document giving the holder a claim on a person for a specified sum.

Personalty—Personal estate and movable property of all kinds.

Petite Bourse—The evening market of the Paris Bourse.

Petite Vitesse—French for ordinary goods train.

Petitioning Creditor—The creditor who files a petition to the Court asking for the debtor to be made a bankrupt.

Petties—A bookkeeping term for small items, too small to be separately specified.

Petty Average—An allowance for towing, etc., now generally included in the freight.

Piece Goods—Goods sold by the piece, such as calicoes, muslins, handkerchiefs, carpets, etc.

Pierage—A charge for the use of a pier (with tackle, etc.) to which a boat is moored or where goods are landed.

Pkg.—Package.

P.L.—Partial loss (marine insurance).

Plain Spirits—Spirits in the original state, with no artificial flavouring added.

Plaint—A legal term for the written statement of grievance against a defendant.

Pleadings—The statements of parties in a lawsuit.

P/m—Put of more. See Options.

pm.—Premium.

P/N—Promissory note.

P.O.B.—Post-Office box.

P O.D.—Pay on delivery.

Policy—A stamped contract of insurance.

Policy Proof of Interest—A term meaning that, in the event of loss, the insured person may recover from the underwriters on the production merely of the policy containing this clause. It is inserted in wager policies, which see.

Pool—A combination of persons to operate jointly in stocks, shares, produce, etc.

Post—To post a book is to make an entry in it, or to transfer an account from one book to another.

Post-date—To date a document with a date later than that on which it is actually signed.

Post Entry—An additional entry made to cover goods beyond those in the original entry. See Entry and Prime Entry.

Post-obit Bond—A bond payable only after the death of the person named in it.

Poundage—A charge of so much in the £, as for a postal order.

Power of Attorney—A legal document by which a person appoints another to act for him. A general power of attorney authorises the agent to act in all matters or in a particular business. A special power authorises for some specified act only.

P.P.—Parcel post.

p.p.—Picked ports (in chartering).

P.p.i.—Policy proof of interest (marine insurance).

Précis—An abstract or summary of a document.

Pref.—Preference or preferred.

Preferred Stock—Sometimes called "B" stock. Part of the ordinary stock entitled to a fixed rate of dividend before anything is paid on "A" or deferred stock, which see.

Premium—(1) A bounty; (2) an annual payment to effect an insurance; (3) a payment for a loan in addition to interest; (4) the difference between the par and current market price of anything, in contradistinction to discount. Such an article is spoken of as being "at a premium."

Pressure—A money-market term, implying difficulty in obtaining money, discounting bills, etc.

Price Current— A list issued by merchants to their customers, setting forth the current market price of the articles they deal in.

Pricking Note—A shipping order from the Custom House to a ship's captain requesting him to take on board bonded or drawback goods for export or ship's stores. See Dandy Note. Dandy and pricking notes are usually combined in one document.

Primage—Formerly an allowance given by the shipper or consignee to a ship's master, over and above the freight. It is now reckoned as a percentage added to the freight for the use of cables, ropes, etc., in loading and unloading. Also called "hat money."

Primage and Average Accustomed—A phrase used in bills of lading. The average is a charge by the ship on the owners of the cargo to cover certain expenses, lights, pilotage, etc. It is generally included in the primage charge.

Prime Cost—The cost of an article before charges or profits are added.

Prime Entry—A provisional Customs entry before goods are landed. After examination and weighing, a post-entry is made of them.

Principal—(1) The head or chief person in a firm; (2) the capital sum upon which interest is paid.

Private Arrangement—An understanding between an insolvent trader and his creditors allowing him to carry on or liquidate the business under specified conditions, instead of going through the Court. This is to save bankruptcy costs. The deed must be registered.

Private Bank—A bank with not more than ten partners.

Private Company—A limited liability company which by its articles restricts the right to transfer its shares, limits the number of its members to fifty, and prohibits any invitation to the public to subscribe for shares.

Private Discount—A foreign money market term for the outside discount rate as distinct from the discount rate of the national bank.

Privileges—An American term for options.

Pro.—For, used by employees when signing for a principal.

Pro Forma—For form's sake. A pro forma account is an account made up to show the charges, commission, etc., on goods which may be ordered or consigned. A pro forma invoice is an invoice which merchants often receive when asked to buy certain goods out of their ordinary line, so that they may know the current price of the goods, cost of packing, discount, etc. When a merchant consigns goods to an agent for sale, he sends a pro forma invoice to give the consignee some idea of the price that is expected.

Prohibited Goods—Goods which may not legally be either imported or exported.

Prohibitions and Restrictions—A Customs term for goods which may not be legally imported or exported, or on which there are restrictions.

Promissory Note—A written promise by a person to pay a specified sum to a certain person named, to his order, or to bearer on demand or on a certain date. Promissory notes are liable to duty, and must be written on stamped paper.

Promotion Money—The sum paid to a person for his work in bringing a public company into existence.

Prompt—The time fixed for the payment of goods, as prompt seven days, meaning that payment is to be made a week from date.

Proof in Bankruptcy—Proof by affidavit of a claim made on a bankrupt's estate.

Property Accounts—In bookkeeping, the different kinds of goods dealt in, such as rope, sugar, etc.

Proprietary Company—A parent company which lets out or sells its property to other public companies, as in the case of land let to a mining company.

Protest—A stamped declaration made through a notary public, that a bill has been presented, and was refused, and that the holder intends to recover all damages sustained. See also Ship's Protest.

Proviso—A provision or condition.

Prox.—Short for proximo, the next succeeding month.

Proxy—One who acts for another; also the deed empowering him to act.

P/S—Public sale.

Public Company—A joint-stock or limited liability company amenable to rules and regulations laid down by Act of Parliament.

Public Funds—See Funds.

Purser—The cashier of a ship or of a mine.

Put—See Options.

Put of More—See Options.

QUALIFIED ACCEPTANCE—See Acceptance.

Quarter Days—In England and Ireland these are Lady Day, March 25; Midsummer Day, June 24; Michaelmas Day, September 29; Christmas Day, December 25. In Scotland they are Candlemas Day, February 2; Whitsunday, May 15; Lammas Day, August 1; Martinmas Day, November 11.

Quayage—The charge for using a quay.

Quittance—A discharge from a debt or other obligation.

Quorum—The least number of persons, as arranged by the rules, that makes a meeting legally capable of transacting business.

R—Rupees.

Racking—Customs term for drawing off wine or spirits from the lees; also for transferring from a large cask to smaller ones, from small casks to a large one, or from an unsound cask to a sound one.

Rack Rent—A rent which is the extreme value of the thing rented.

Rateable Value—The value of property after deducting an allowance for repairs, etc.

Rate of Exchange—The amount given in one country's currency for a sum in another country's currency. Rates of exchange fluctuate.

Raw Materials—Materials in their natural state before being used in manufacture.

R/D—Refer to drawer (banking).

R.D.C.—Running-down clause.

Re—In regard to.

Real Estate—In contradistinction to movable property, which is personal estate. This consists of manors, tithes, advowsons, copyhold and freehold property, etc.

Rebate—An allowance in price. In banking it is an allowance given in consideration for taking up a bill of exchange before it has matured.

Receiving Note—A note addressed by the shipper to the chief officer of a vessel, asking him to receive on board the goods specified.

Re-draft—A new bill of exchange drawn by the holder of a protested bill on the drawer or endorser, for the original amount, with costs and charges.

Re-exchange—A charge made upon the drawer of a dishonoured foreign bill of exchange when the holder redraws a fresh bill.

Reference—A declaration as to a person's commercial integrity.

Registered Bond—Bonds registered in the holder's name in the books of the company issuing them.

Registered Offices—The official address of a company, so called because it is the address registered at the Joint Stock Companies Registry. It is the place where all legal and other notices to the company must be served.

Registered Stock—Stock registered in the holder's name at the bank or office where it was issued.

Register of Members—See Share Register.

Re-insurance—When an underwriter fears he has taken too great a risk, he re-insures his interest with other underwriters at a higher premium, and this is called a re-insurance.

Release—A document setting a person free from an engagement.

Re-lease—To grant a new lease.

Renew a Bill—To accept a new bill of exchange in place of an old one that the debtor could not meet.

Rentes—The annual interest payable on French, Austrian, Italian, and Greek stocks.

Report—To report a ship is to pass all the Customs formalities, so as to obtain permission for unloading.

Re-rummage—A ship is rummaged when unloading and re-rummaged when being loaded. See Rummage.

Respondentia—A loan raised on the cargo of a ship on the personal responsibility of the master. If the vessel be lost, the lender loses his money. See also Bottomry.

Rest—In banking an accumulation of undivided profits, after payment of dividends, kept as a reserve to meet possible losses.

Restrictive Endorsement—An endorsement on a bill of exchange that has been endorsed over to another person, preventing him from transferring it again, or restricting him from dealing with it otherwise than as directed in the endorsement.

Retire a Bill—To pay a bill when it becomes due.

Retire a Bill Under Discount—To take up a bill before it is due, the holder allowing a discount on it.

Return of Premium—In marine insurance, the return by the underwriters of the overplus when anything has been insured for more than its actual value.

Returns—(1) The amount of sales for a given period; (2) a report of transactions; (3) cases returned by a purchaser, after he has removed the goods sent in them; (4) tabulated statistics; (5) an account of goods taken on board ship, as brokers' returns.

Rev. a/c—Revenue account.

Reversion—The right to property after some particular event, such as the death of the holder.

Rider—An addition to a document after completion, or an additional clause to a resolution.

Rig—To rig a market is to force up the price of a security, and is usually done by buying up sufficient to create a scarcity.

Rigger—One who rigs a market.

Ring—A combination of financiers or capitalists to manipulate produce or securities and regulate the price.

R/p—Return of post.

Rs.—Rupees.

R.S.O.—Railway sub-office.

Rummage—To rummage a ship is for the Customs officers to search her for dutiable or prohibited articles when she is unloading. See Re-rummage.

Running Days—A chartering term for consecutive days, Sundays and holidays excepted, in which the cargo is to be loaded or discharged.

Running-down Clause—A clause in a marine insurance policy by which the underwriters agree to pay a proportion of damages assessed by a law court against a ship for injuring another vessel in collision.

Running Hours—Consecutive hours allowed for loading or unloading a ship.

Running of Goods—The secret landing of goods without paying legal duties. Such goods are said to be "run on shore."

Running Policy—In marine insurance, an open policy (which see) where the risk attaches to the goods on board during a period or up to a specified day.

Rupee Paper—Promissory notes of the Indian Government, payable in rupees.

$—Dollars or dollar.

S.A.—Subject to approval.

Sag—Prices "sag" when they fall away gradually.

Sale Note—A contract note sent by a merchant to a buyer specifying the quantity of goods sold, the price, and other particulars.

Sale Warrant—A warrant issued with a weight note when a deposit is paid on goods sold, and exchanged for the actual warrant for the goods when the balance is paid.

Salvage—An allowance paid to those who help to save a ship and its cargo from the perils of the sea; also goods so saved; and, thirdly, goods saved from a fire.

Salvage Loss—In marine insurance, the difference between the value of the property insured and that of the goods saved, plus charges, this difference being settled by the underwriters.

Sample—A small part of any merchandise shown as a specimen of the whole. A "fair average sample" is one made up of portions of different lots or portions selected from different places in one lot and bulked together.

Sampling Order—An order to a wharfinger authorising him to permit samples of goods in his wharf to be taken away by the bearer of the order.

Sans Frais—Without expense.

Sans Recours—"Without recourse to me." A phrase in the endorsement of a bill or note when the endorser wishes to free himself from responsibility.

S.B.—Sales Book.

s.c.—Sharp—that is, prompt—cash.

Scp.—Scrip.

S/D—Sea-damaged, used in grain trade.

Scrip—Short for "subscription." A receipt for money paid as instalments for shares in public companies, etc., and exchanged for a share certificate.

Sea Letter—Same as Ship's Passport, which see.

Searcher—A Customs officer who searches ships for contraband and dutiable goods.

Seconda Via—A second copy of a letter, sent independently to ensure arrival in case of the original miscarrying.

Second-class Paper—See Fine Paper.

Secured Creditor—A creditor who holds security, such as a mortgage, bill of sale, etc.

Seigniorage—The difference between the price paid for bullion and the face value of the money into which it is coined.

Seizin—The possession of an estate.

Seizure Note—A document used when smuggled goods are detected and seized by the Customs authorities. The note is filled in by the officer seizing the goods.

Seller's Option to Double—Put of more. See Options.

Sellers Over—A term for when there are more sellers than buyers.

Selling Out—When a buyer has not taken up his securities at the time agreed, the seller can sell the securities elsewhere, and charge the buyer with all the expenses to which he has been put. This is called selling out.

Sequestration—Placing a property in the hands of a person other than the owner, for one of three reasons: (1) When it is in dispute; (2) when the owner is bankrupt; (3) when the profits are needed to pay demands on it. The person to whom the estate is entrusted is called a sequestrator.

Set of Bills—Same as set of exchange.

Set-off—A counter-claim made against a person who is making a claim, as where parties are indebted to one another, when one debt is set off against the other and the balance only paid.

Set of Exchange—Three identical bills drawn at one time and forwarded by different routes, the acceptance or payment of the first to arrive cancelling the others. See also Sola Bill.

Settling Day—Same as Pay Day.

Settlement—On the Stock Exchange, the periods, occupying three days, and occurring twice a month, when shares are taken up and paid for or differences settled. The actual day on which the settlement takes place is called settling or pay day. The preceding day is "ticket day," when tickets pass between brokers and jobbers so that each may know what he has to deliver or receive on pay day. The day before ticket day is contango day, when the contango (which see) is fixed for bargains that are being continued.

Sh.—Share. See page 2984-5

Share Register—The register containing the names of persons holding shares in a limited company, and the extent of their holdings. Also called register of members. See page 2983

Shipbroker—An agent for a shipowner who obtains cargo, effects insurance, and attends to the general business of the ship.

Shipmaster—The captain of a ship.

Shipping Advice—An advice from a railway company declaring that they have forwarded goods to the docks for shipment on a certain vessel.

Shipping Bills—A Customs document used where drawback is claimed where dutiable goods are shipped for re-export or for ship's stores. Also a document giving details of a ship and goods for statistical use.

Shipping Notes—The receiving note and mate's receipt, which see. Shipping notes are always in these two parts.

Shipping Parcels Receipt—A document on which small packages of goods not exceeding £5 in value are generally shipped.

Shipping Specification—A form on which are supplied to the Customs particulars of goods shipped.

Shipping Weight—The specified weight of goods when put on board.

Ship's Certificate of Registry—A document giving the ship's name, tonnage, owner, master, etc., which shows that she is entered at the Custom House, and is entitled to enjoy the privileges of a British-built vessel.

Ship's Clearance—Permission by the Customs for a ship to unload (clearance inwards) or to sail (clearance outwards) when all the necessary formalities have been complied with.

Ship's Husband—An agent who looks after the management of a ship's affairs, attends to repairs, provides stores, etc., while she is in port.

Ship's Papers—The certificate of registry, manifest, licence, passport, muster roll, bill of health, log-book, articles, bills of lading, and, if there is one, charter party.

Ship's Passport—A document given to a neutral ship in war-time, authorising her to sail.

Ship's Protest—A declaration by the captain of a ship describing the circumstances in which injury to the ship or cargo occurred. The protest must be made immediately on arriving in port, and recorded by a notary public.

Ship's Report—A form that must be filled up by the master of a ship within twenty-four hours of arriving at any port in the United Kingdom, giving various particulars as to ship, cargo (if any), and crew.

Ship's Store Bond—A bond given to the Customs by the master of a ship when dutiable articles are to be taken on board as stores.

Ship's Stores—Articles such as food, drink, cigars, etc., that are required for crew and passengers on a voyage. In Customs documents it refers to those that are dutiable.

Short Bill—A bill of exchange payable on demand or having less than ten days to run.

Short Exchange—The rate of exchange for bills payable ten, twenty, thirty, or more days after sight.

Short Interest—In marine insurance, the amount over-insured, when the interest declared is less than the sum insured. The assured person can claim the return of premium on this amount. See also Over-insurance.

Short Loan—An advance made for a short period.

Short Money—Same as Short Loan.

Short of Stock—The American Stock Exchange term equivalent to the English "bear."

Short Shipment—Part of a consignment left behind, either by accident or because of lack of room in the ship.

Shut for Dividend—A term used when the transfer books of a bank or company are closed for the preparation of dividend warrants.

Shut Out—Term used when goods are left out of a ship owing to lateness or lack of room.

S.I.—Short interest.

Sight Bill—A bill of exchange payable at sight—that is, when presented.

Sight Entry—Same as Bill of Sight.

Signatories—Persons who sign a company's articles of association.

Signature Book—Book kept by a bank for the recognised signatures of depositors, so that in cases of doubt signatures may be verified.

Skipping—Customs term for temporary transferring of goods from one package to another for the purpose of taring.

S.L.—Sigilli Locus, the place for the seal on a document. Sometimes written L.S.

Sld.—Sailed.

Sleeping Partner—A person with money in a business, in the conduct of which he takes no active part. Called also dormant partner.

Sliding Scale—A scale fixing wages according to the rise and fall of price in the goods produced.

Slinging—A shipping charge for hoisting goods by chains from lighters to the ship.

Slip—In marine insurance, a piece of paper bearing the name of a ship, description of goods, and amount of insurance, signed by Lloyd's underwriters prior to policy being issued.

S/N—Shipping note.

S.O.—Seller's option.

S.O.D.—Seller's option to double.

Sola Bill—A bill of exchange of which only one copy is made. See also Set of Exchange.

Sold Note—A note with details of a sale sent to a buyer.

Solvency—The state of being solvent—that is, able to pay all one's debts in full. See Insolvent.

S.P.—Supra protest.

Special Endorsement—An endorsement on a bill of exchange stating the name of the person to whom it is transferred.

Special Settlement—Special days fixed by the Stock Exchange for the settlement of foreign loans, new issues, etc.

Specie—Coins, as distinguished from paper money or bullion.

Specie Point—The rate of exchange produced by the sale in one country of gold bought in another.

Spedition—Forwarding.

Spits—Rods of wood or metal used by Customs officers to insert in bales, etc., when searching for dutiable articles concealed.

Spot—Term used of goods actually on the spot, available immediately.

Stag—Stock Exchange term for a person who takes shares in a new company to sell directly they are at a premium

Stagging—The operations of a "stag."

Stale Cheque—A cheque that remains unpaid a long while.

Stamp Note—A Customs document giving permission for goods to be loaded on board ship.

Standard Gold—The gold of English coinage—22 parts of pure gold with 2 of alloy.

Standard Silver—The silver of English coinage—37 parts of pure silver with 3 of copper.

Statement—An account for goods owing, issued at regular intervals by a trader.

Station—Customs term for one or more warehouses.

Stem—To load a ship with coals within a certain period.

Sterling—A term used to distinguish English money.

Sterling Bonds—American railroad bonds payable here in English money.

Stet—Let it stand. Term used to indicate that a word or phrase crossed out is to remain as originally written.

Stiffening Order—A Customs permission for a ship to load heavy goods as ballast to steady her in the water, previous to permission for the general loading.

Stock—The national debt of a country; the share capital of a public company; an accumulation of goods.

Stock-jobber—See Jobber.

Stock Receipt—A receipt for the consideration money which the seller of stock gives, enabling the purchaser to have the stock registered in his own name.

Stop—A stop is put on a cheque, bill of exchange, banknote, etc., when it has been stolen or lost, by instructing the bank not to pay it if presented.

Stoppage in transitu—The stoppage of goods during transit. The consigner has the right to do this until the full price for the goods has been paid.

Stow—To pack merchandise in a ship so that it will not shift or get damaged on the voyage.

Stowage—The packing of cargo in a ship; also wages paid for stowing. See Dunnage.

Stranding—In marine insurance, the running of a ship on a rock, sandbank, or shore, and remaining there for a considerable time. Mere striking is not stranding, however great the damage.

Sub-lease—A lease by a lessee to another party.

Sufferance Wharf—A wharf licensed by the Customs for the landing and storing of dutiable goods.

Supra Protest—To sign a document or pay a sum supra protest is to do so under the impression that one is in danger of being wronged.

Survey Report—A document by an independent party stating what allowance should be made for goods that have been rejected on arrival owing to damage or other cause.

Suspected Bill—See Bill of Health.

Sworn Meter—In the grain trade, a document certifying particulars as to the quantity taken from a ship. It is signed by the discharging agents, and freight is charged on it.

T.—Tons.
Take in—To receive backwardation.
Take up—To pay for a thing, as to take up a bill of exchange when it is due, or to take up a bill of lading by paying the freight due.
Tale Quale—To take anything—a cargo of grain, for instance—as it is, with all faults.
Tallying—Checking another person's count.
Talon—A certificate attached to the coupon sheet of transferable bonds, which may be exchanged for a further series of coupons when the first is exhausted.
Tape Prices—Stock Exchange and market quotations recorded on the tape telegraph instrument.
Tare—An allowance for the package in which goods are sent. Real or actual tare is for the exact weight of the packing; average tare for the average weight of a number of similar packages; customary tare for the established usual weight allowed; estimated tare for the estimated weight of a package similar to others of known weight; super tare, an additional tare made where the package exceeds a certain weight.
T/C—Till countermanded.
Telegraphic Transfer—The payment of money to another country by a cable order.
Telegraph Restante—A term used where a telegram is to remain at the telegraph office till called for.
Tel quel—Same as Tale Quale.
Tender—An offer of money to pay a debt; also a written offer to buy or sell certain goods. See also Legal Tender.
Tenure—The manner of holding lands or buildings.
Term Days—The days on which rents fall due.
Terminable Annuities—Annuities sold by the Government for specified periods.
Term of a Bill—The time for which a bill of exchange is drawn.
Third-class Paper—See Fine Paper.
Ticket Day—See Settlement.
Time Bargains—Speculative Stock Exchange transactions for periods beyond the fortnightly settling-day.
Time Policy—A marine insurance policy for a specified period, and not for a voyage. No marine policy is good for more than twelve months.
T.L.O.—Total loss only (in marine insurance).
Token Money—Coins worth intrinsically less than their face value, like our silver and bronze money.
Tonnage Dues—A charge of so much per ton on a ship's registered tonnage, upon her entering or leaving a port.
Tontine—A scheme by which a number of persons buy a life annuity for each. As each dies, his share is divided among the others, until the last survivor eventually enjoys the whole.
Towage—Charge for towing a ship.
T/q—Tale quale.
T/R.—Tons registered (shipping).
Tr.—Tare.
Trade Rights—Proprietary rights, other than brands or trade marks, belonging exclusively to a firm that has built up a business.
Transfer Days—Fixed days at the Bank of England, etc., for registering transfers of stock.
Transires—Duplicate accounts on prescribed forms, giving full details of a ship's cargo, with names of both shipper and consignee. The duplicate, given up to the Customs, clears the boat outwards; and the original, given up at the destination, is the ship's entry inwards.
Treasury Bills—Bills issued at a discount by the Treasury in return for money lent to the Government. They bear no interest.
Tret—An allowance sometimes made on goods for waste, dust, etc.
Trim—To ballast a boat so as to steady her; also to stow coal or other bulk cargo so that it is distributed evenly.
Trinity House—The institution that regulates the marine interests of the United Kingdom, erecting lighthouses, appointing pilots, conducting mariners' examinations, etc.
Truck—Paying wages in goods instead of money.
Trust—A large combination of capitalists to conduct a business.
Trustees in Bankruptcy—Persons appointed by the Court to manage a bankrupt's estate during liquidation.
T.t.—Telegraphic transfer.
Turn—The profit which a stock-jobber makes on a transaction with a broker.
Turnover—The total amount of goods sold over a given period.
Type—A standard sample of produce, such as corn, rice, sugar.

ULLAGE—The difference between the capacity of a cask, or other vessel, and the quantity it actually contains; also the waste in casks, etc., from leakage, evaporation, and similar causes. An ullaged cask is one that has lost some of its contents.
Ult., Ultimo., Ulto.—The last month, used in correspondence when referring to dates.
Ultra Vires—When a company, etc., exceeds the authority granted by law, it acts "ultra vires."
UN—Unified.
Uncalled Capital—The difference between the subscribed capital and the called-up capital of a company.
Under Bond—Dutiable goods, when removed from place to place, are "under bond" to pay the duty if not produced at their destination.
Under Protest—See Supra Protest.
Underwriter—A marine insurer, so called from his signature under each policy.
Underwriting—In company work, guaranteeing that the capital of a new company shall be subscribed.
Unfunded Debt—Loans, represented by Exchequer and Treasury bills and bonds, borrowed for short periods, which the Government is bound to pay at specified dates.
Unified Stock—Several loans at different interest amalgamated into a common debt at a fixed interest.
Unlimited Company—A company whose shareholders' liability is not limited to the amount of their shares.
Unmerchantable—Goods unsound or below standard.
Usance—The period allowed between two places for the currency of foreign bills of exchange.
Usufruct—The right to use anything belonging to another, and acquire the profit or benefit resulting, but without diminishing its substance.
U/w—Underwriter.

VALUE—Face value is the sum printed on the face of notes and securities. Nominal value means the nearest price named without business passing.
Valued Policy—A marine insurance policy in which the amount insured is valued or fixed.
Value in Account—A term used in bills of exchange when the drawer has a commission or balance to draw from the drawee.
Value Received—Term used in bills of exchange when the drawee has received money or goods from the drawer.
Value Upon—To draw a bill upon.
Vatting—Customs term for mixing various wines or spirits in a large vessel to obtain uniformity.
Vendor's Shares—Shares taken in lieu of cash by a person transforming his business into a company.
Vendue—A public auction.
Venture—Goods shipped at the sender's risk for sale at the place of destination.
Via—The copy of a document sent by a different route from that of the original, so as to replace the latter if it goes astray.
Victualling Bill—A list of dutiable goods taken on board ship for use as stores, given to the Customs by the captain.
Voucher—A written document giving proof of a money transaction.
Voyage Policy—A marine insurance policy insuring a ship or cargo for a certain voyage.

WAGER POLICY—A policy on which there is no real interest at risk, and the underwriters do not require the usual documents to prove a loss.
Waiver Clause—A clause in marine insurance which declares that no acts of insurer or insured in recovering, saving, or preserving the property insured shall be considered as an acceptance of abandonment.
Wall Street—The New York Stock Exchange.
Warrant—A receipt for goods deposited in a warehouse, and transferable by indorsement. Must bear 3d. stamp.
Warranty—In marine insurance, a condition which, if not complied with, vitiates the contract.
Watering Stock—Increasing capital by creating new stock without corresponding provision for paying dividends.
W.B.—Way-bill; warehouse book.
w.b.—Water ballast.
Wd.—Warranted.
Weight Note—A document issued by a dock company giving gross weight, tare and net weight, marks, numbers, and date of entry of imported merchandise.
W.I.D.—West India Docks.
Wind Bill—Same as Accommodation Bill.
Window-dressing—Money-market term for the swelling of a bank's cash balance in the monthly statement by calling in loans, etc.
Without Engagement—A term used when quoting goods liable to fluctuation, and implying that the merchant does not bind himself to accept an order at the price.
Without Recourse—A term often used on a bill of exchange, implying that the buyer has no recourse on the seller if the bill is not paid when due.
W.O.B.—Washing overboard (marine insurance).
W.P.—Without prejudice.
W/W—Warehouse warrant.

X.c.—Ex coupon.
X.d.—Ex dividend.
X.in.—Ex interest.
X.new—Ex new.

Y/A—York-Antwerp Rules.
York-Antwerp Rules—In marine insurance this term means that both parties agree that in case of general average the adjustment shall be made according to the rules of the Underwriters' Conference at Antwerp in 1877.

ZOLLVEREIN—A Customs union between various States.

#—Numbered, as # 1/30.

PRIME MOVERS & STEAM BOILERS

ACTUAL HORSE-POWER—Horse-power obtained by the indicator, minus the power absorbed by the engine friction.

Adhesion—Specifically, the measure of the weight resting on the wheels of locomotives.

Air Pump—A pump employed in all condensing engines for removing the mixed air and water from the condenser.

Asbestos—A fibrous mineral, which, owing to its heat-resisting character, is prepared for use in engine packings and joints.

Atmospheric Engine—An early type, in which the pressure of the air moved the piston downwards against a partial vacuum.

Atmospheric Line—The line on an indicator diagram which divides the steam area from that of vacuum.

BACK PRESSURE—Pressure opposed to the movement of the piston in a cylinder, due to steam not wholly exhausted.

Balloon Boiler, or Haystack Boiler—An obsolete form, of a dome shape, externally fired.

Barring Engine—A small engine used for starting a very large engine.

Beam Engine—A vertical engine having the piston-rod operating one end of a pivoted beam, and the connecting rod at the other.

Bed Plate—The base, usually a casting, which carries all the mechanism of an engine.

Blast Pipe—In a loco. boiler, the pipe through which the steam exhausts into the chimney, so creating a sharp draught in the fire-box.

Blow-off—The periodical discharge of steam, water, and sediment from a boiler.

Boilers—The steam generators for engines. Internal combustion engines require no boilers.

Brake Horse-power—Horse-power as measured by a friction brake.

CALORIE—The French unit of heat, or that which will raise 1 kilo. of water through 1° C. between the temperatures of 0° C. and 1° C.

Carnot's Principle—Postulates the law that the work done by a heat engine is wholly a question of temperature.

Central Valve Engine—An engine in which the distribution of steam is effected by openings in the piston-rods.

Cheval-Vapeur—French horse-power, or 4,500 kilogrammes lifted 1 metre high per minute, equals 0·9863 English horse-power.

Chimney—The function of a chimney is to produce a draught in the furnaces and flues of a boiler. It acts by virtue of the difference in the specific gravities of the hot air within and the cold air without.

Circulating Pump—A pump which forces the cooling water through the tubes of surface condensers.

Clark's Process—The best known process for softening the feed-water for boilers by the addition of lime thereto.

Clearance—The space left between the face of a piston at the termination of its stroke and the inner face of the cover, to prevent actual contact. Freedom to exhaust in an engine cylinder.

Clinkering—Cleaning the grate bars of boilers periodically.

Closed Ashpit—Signifies that the ashpit alone receives air under pressure.

Closed Stokehold—The stokehold enclosing the boiler front of a marine engine which receives the supplies of air through fans only.

Cold-water Test—The hydraulic pressure test applied to steam boilers with cold water.

Compound Engine—An engine having two or more cylinders in which steam works expansively in succession.

Condenser—The vessel in which the exhaust steam from an engine or engines is condensed to water.

Condensing Engine—One in which the exhaust steam goes into a condenser instead of into the atmosphere.

Connecting Rod—The rod which connects the piston and its cross head to the crank of the flywheel shaft.

Corliss Engine—One in which separate valves are used for the entering and exhausting steam.

Cornish Boiler—A horizontal boiler with a single furnace flue.

Cornish Engine—A special type of beam engine, used first in the Cornish mines.

Corrugated Furnace—A type of boiler furnace which is stiffened against collapse by alternating ridges and depressions.

Crank-pin—The pivot on which the free end of the connecting rod takes its bearing, being the end opposite to the crank shaft.

Cushioning—The elastic counter-pressure against a piston, bringing it to rest by the steam admitted through the opening to lead.

Cut-Off—Arresting the supply of steam to the interior of a cylinder.

Cut-off Valve—A supplementary slide valve on the back of a main valve for working steam at high expansion.

Cylinder—Specifically the vessel in which the movements of an engine piston are coerced.

DAMPERS—Sliding, or swivelling plates which regulate the draught through boiler flues.

Dead Centres—When the axis of the piston-rod, the crank-pin, and the crank-shaft are in one plane the engine is on dead centres.

Dead-weight Safety Valve—One in which the loading is done directly by the imposition of annular weights.

Double Acting—Expresses the case of pistons which are subjected to pressure on opposite sides alternately.

Dry Steam—Steam which is only saturated with moisture by contact with the water from which it is generated.

Duty—The duty of an engine is the number of foot pounds obtained by the burning of a bushel of good coal. The term is nearly obsolete.

D-valve—The form of slide valve which has a section nearly like that of the letter D.

Dynamometer—A mechanism by which the power given off or absorbed by a prime mover or machine is measured.

ECCENTRIC—The agent by which the rotary motion of the crank is converted into the reciprocating movement of the slide valve.

Eccentric Sheave—The body of an eccentric, keyed on the crank-shaft.

Eccentric Straps—The bands which encircle the sheave, and transmit its motion to the eccentric rods and slide valve.

Economiser—A nest of pipes in which the feed-water for boilers is heated by the waste gases from the boiler.

Elastic Force—The expansive, or heat energy of a gas.

Enclosed-type Engine—Stationary engines having the working parts wholly enclosed, and running in an oil bath.

Evaporative Power—It is usual to estimate the value of different fuels by the relative quantities of water which they will evaporate.

Exhaust Steam—The waste steam from an engine cylinder.

Expansive Working—A definite volume of steam or gas doing work on a piston by the force of its own expansion.

External Firing—The application of heat outside a boiler shell. Now obsolete.

FEED PUMP—The pump which supplies feed-water to boilers.

Feed-water Heater—A type of economiser in which the feed is heated before being passed into the boiler.

Ferrules—Rings used for fastening the tubes of boilers and condensers into their plates.

Final Pressure—The pressure of steam in a cylinder in the last stage of its expansion.

Fire-bars—The grate bars in a boiler furnace.

Fire-box—The furnace of a locomotive or a vertical boiler.

Forced Draught—Air for combustion in steam boilers which is introduced under pressure by fans.

Furnace Flues—The furnaces of horizontal boilers, placed within the shell.

Fusible Plug—A plug of easily fusible alloy, inserted in the top of a boiler furnace, which melts and lets the water out if the water runs dangerously low.

GAS ENGINE—Any engine using gas, which may be town, or producer, or blast-furnace gas.

Gaskets—Packings of hemp rope used in stuffing boxes.

Gauges—Instruments for indicating pressure of steam, and vacuum, and water levels.

Governor—A device which automatically reduces variations in speeds of prime movers.

Grate Area—The superficial area of the fire-grate of a boiler.

Guides—Flat bars, or cylindrical tubes by which the movements of the crosshead are coerced.

HEAT ENGINE—Any prime mover which is actuated by heat contained in a gaseous fluid.

Heating Surface—The area of a steam boiler which is exposed to flame and hot gases on one side and water on the other.

High-pressure Engine—Any engine which uses steam at a pressure higher than the ordinary at a given period. The high pressures of a few years ago would not be classed as such now.

High-speed Engine—One which has a high rotative or a high piston speed in comparison with ordinary engines. The term is therefore relative.

Horse-power, or H.P.—33,000 lb. lifted 1 ft. high per minute.

Hot-air Engine—One in which atmospheric air is used, which is alternately heated and cooled.

Hot-water Test—The hydraulic pressure test applied with hot water to steam boilers.

Hydraulic Engine—One, the motive-power of which is water under high pressure.

INDICATED HORSE-POWER, or I.H.P.—The horse-power of an engine obtained by an indicator.

Indicator—An instrument for recording on a card the varying pressures of steam in a cylinder.

Indicator Diagram—The diagram traced by an indicator.

Induced Draught—Boiler draught induced by a fan placed in or near the chimney in the course of the flues.

Induction Port—The opening of the passage through which steam is admitted to a cylinder.

Ignition—The act of firing the charge in the cylinder of a gas engine.

Injector—A device for supplying feed-water to a boiler.

Internally Fired Boiler—One which has its furnace within the shell or water casing.

JACKETING—Surrounding an engine cylinder with a chamber supplied with steam.

LANCASHIRE BOILER — A two-flued horizontal land boiler.

Lap—The distance by which the edges of a slide valve when in middle travel overlaps the induction ports.

Latent Heat—The heat which disappears during the vaporisation or the fusion of a substance, without raising the temperature.

Lead—The distance by which the edge of a slide valve opens the exhaust port at the termination of the piston stroke.

Liner—The lining tube of hard metal fitted within many engine cylinders.

Link Motion—The arrangements of slot link, eccentrics, and rods used for actuating the movements of slide valves.

Live Steam—Steam as it comes from the boiler.

Lubricators—Vessels which contain liquid or solid lubricants for the supply of bearings.

MAIN BEARINGS—The bearings of the crank shafts of engines.

Mean Pressure—The average of the entire range of steam pressures in a cylinder from the moment of inlet to that of final exhaust.

Metallic Packings—The steam-tight joints made in stuffing boxes with elastic rings of metal.

NEWCOMEN'S ENGINE—The pattern on which the early steam engines were built. It was operated by atmospheric pressure.

Nominal Horse-power (N.H.P.)—A commercial term, a survival of an early practice, of little value under changed conditions.

Notching-up—In link motions, pulling the link nearer to the centre, with resulting earlier cut-off and higher expansion.

OSCILLATING ENGINE—A nearly obsolete type, in which the oscillation of the cylinder was made to operate the slide valves.

PACKINGS—Materials used in stuffing boxes for rendering piston and valve rods steam-tight in their holes.

Piston Speed—The speed of movement of a piston measured in feet per minute.

Piston Valve—A sliding valve which is of cylindrical section.

Prime Mover—A machine which utilises the forces of Nature for the service of man.

Priming—The mixing of particles of water with steam.

Producer Gas—Gaseous fuel generated by the combustion of solid fuel in gas producers of various kinds.

QUADRUPLE EXPANSION ENGINE—One in which the steam is expanded through four successive cylinders before exhausting to the condenser.

RECEIVER—The steam chest, pipe, or special vessel through which steam passes from one cylinder to the next in compound engines.

Return Tube Boiler—The marine, or Scotch boiler, in which the smoke tubes return over the top of the furnace to the front of the boiler.

Reversing Rolling Mill-engine—A special design used for rolling steel plates and sections, the direction of movement being reversed between each pass.

Right-hand Engine—One in which the flywheel stands to the right, when viewed from the front of the engine.

SAFETY VALVE—A valve on a boiler which opens when a definite steam pressure is exceeded, so relieving the steam pressure.

Saturated Steam—Steam in contact with water of the same temperature.

Scale—Deposit which hardens on the water side of the plates of steam boilers.

Setting of Boilers—Fixing land boilers over their flues, and seatings of brickwork.

Slide Valves—Valves occurring in numerous forms, the function of which is to control the supplies of steam to cylinders, as distinguished from lift or drop valves and rotating valves.

Slipper—Slipper bars are guide bars; a slipper block is a piston crosshead.

Slot Link—The link through which variable expansion, and reversals are effected.

Smoke—Particles of solid carbon suspended in unburnt gases, and vapour of water. Its proper combustion is the object of many devices in boiler engineering.

Soda—Used for preventing scale in boilers.

Split Draught—The arrangement of flues in Lancashire boilers in which the products of combustion are divided at the back, and pass round to right and left.

Stationary Engine—One fastened to foundations.

Steam—The vapour of water, which, by virtue of its elastic energy, communicates motion to a piston or rotor.

Steam Chest—see *valve chest.*

Superheated Steam—Steam made hotter than the temperature at which it is generated.

Surface Condenser—One fitted with tubes in the steam space, and through which the cold water circulates. It differs in this respect from the jet condenser, which receives one jet of water.

TAIL ROD—A rod in continuation of a piston, or valve rod, but on the opposite side. Its function is to steady the movements of the piston, or valve.

Tandem Engine—A compound engine, the cylinders of which are in the same longitudinal axis.

Thermal Unit—The amount of heat required to raise 1 lb. of water 1° F. is the British Thermal unit, and is equivalent to 772 foot-pounds.

Three-cylinder Engine—Specifically an engine in which the cylinders are arranged round a circle, with their axes 120° apart.

Throttle Valve—A valve which opens and closes the supply of steam from a boiler to an engine.

Throw—Twice the radius of an eccentric or a crank.

Tractive Force—The power exercised by the pistons and driving wheels of a locomotive to move a train.

Travel—The length of movement of a piston or a valve.

Triple-expansion Engine—One in which the steam is expanded from one high-pressure into two low-pressure cylinders in succession.

Trip Lever—A lever which lifts drop valves through a certain distance, and then allows them to close sharply.

Try Cocks—The steam and water-cocks on a boiler which indicate the highest and lowest water level allowable.

Tube Expander—An appliance used for tightening the fire-tubes in multi-tubular boilers.

Tubes—Tubes of brass, steel, iron, or copper are used in boilers to convey the heat from the fire-box through the water to the smoke-box.

Tube Surface—The total area of the exterior surfaces of condenser tubes.

Tubular Boiler—Any boiler provided with nests of tubes to increase the heating surface.

UNDERTYPE ENGINE — A fixed engine with a locomotive type of boiler, in which the engine is fixed beneath the boiler.

Unit—A standard for calculations—as the unit of heat, of work, of mass, of strength, or of stress.

VACUUM—The amount by which the pressure of a condenser is below that of the atmosphere. It is measured in pounds, or in inches of mercury.

Valve—The agent by which the opening of steam and exhaust passages is controlled. It may be a slide valve, flat, or of piston type, or a drop, or a partly rotating valve. Or a main, or a cut-off valve.

Valve Chest or Steam Chest—The casing which encloses a slide valve.

Valve Diagrams—Diagrams made to show graphically the cycle of action of valves.

Valve Setting—Adjusting valves in relation to the crankpin and the eccentric sheave.

Variable Expansion—The expansion of steam in a cylinder caused by alterations in the opening of the throttle, or in the point of cut-off of the valves.

Varying Travel—The travel of a slide valve which is varied momentarily by expansion gear, instead of being constant by a fixed eccentric only.

Vertical Boiler—A cylindrical boiler having its axis set vertically.

Vertical Engine—An engine having the axis of its cylinder set vertically.

WAGGON BOILER—An obsolete form, deriving its name from its cross section. It was externally fired.

Wall Engine—A steam engine, the bed-plate of which is bolted to a factory wall, the axis of the engine being vertical.

Waste Heat—Residual heat from furnaces which, formerly lost, is now frequently utilised in warming feed water, or brickwork, or air and gas.

Water Pressure Engines—Engines of rotary or reciprocating types which are operated by water under pressure.

Water-tube Boiler—A steam boiler in which the fire plays around nests of small water-tubes variously arranged.

Weight Shaft—The shaft which carries the lever for lifting and lowering the slot links of valve gears.

Wheel Draught—The arrangement of flues in Lancashire boilers, in which the products of combustion pass round the boiler in one direction.

Winding Engine—A hoisting engine designed specially for hauling mine waggons up inclines.

Windmill—A wind engine, the chief use of which now is to drive well pumps in country districts.

Wire Drawing—Steam is wire-drawn when passages are made too small to permit it to enter with freedom into the cylinder.

Wire Gauze—Finely-woven wire used for making steam-tight joints between flanges.

Woolf Engine—An early compound engine in which the crank-pins were set 180° apart.

Wrist Plate—The rocking disc which transmits motion to the valve spindles of Corliss engines.

THE BUILDING TRADES

BUILDING CONSTRUCTION

ABUTMENT—The solid part of a pier from which an arch springs directly.
Ancient light—An opening for the admission of light and air that has, by prescription, obtained a legal right to such easement in perpetuity.
Angle of repose—The natural angle at which any given material will remain at rest.
Annulet—A fillet or band circular on plan.
Applied ornament — Ornament attached to the surface, not worked on the solid.
Area—An enclosed court or yard. A sunk space arranged for lighting or for access to a floor below the ground level.
Arris—The line formed at an exterior angle by two intersecting surfaces.
Aspect—The quarter of the heavens which any front or opening of a building faces.
Astragal—A small moulding semi-circular in profile.
Attend upon—A term indicating the assistance to be given to each tradesman by other trades.
Attic story—A story formed wholly or partly in a roof.

BALCONETTE—A small balcony.
Barrel roof—A roof of which the soffit is semi-cylindrical.
Base—The foot or lowest portion of any part of a building.
Basement—The story of a building below the principal or ground floor.
Bay—The subdivision longitudinally of a building by piers, arches, girders, etc.
Beam—A piece of timber or iron placed horizontally—generally over a void.
Beam compass—An instrument for drawing large circles composed of a lath and adjustable slides carrying the point and pen and pencil.
Bearing—The area of support to the end of a joist or beam. Also used to denote the clear distance intervening between such points.
Bed—The horizontal surface on which stones, bricks, and other substances used in building rest. In arches the bearing surface on each side of a voussoir.
Bed mould—A moulding immediately below and apparently supporting an overhanging surface.
Bevel—The slope formed by cutting off a right-angled arris by a plane intersecting both original planes.
Block plan—A plan showing a site on which only the outline of buildings is indicated.
Boning—The act of making or judging a plane surface or line by the eye.
Break—The recess or projection of one piece of work behind or in front of the remainder.
Bullnose—A rounded junction between two surfaces enclosing an angle.
Buttress—A mass of masonry or brickwork so disposed as to counteract the thrust exerted by an arch or vault.

CAMBER—A slight convexity to counteract deflection due to load.
Camp-sheeting—A timber retaining-wall to prevent erosion in rivers and canals.
Cant—Any part of a structure formed at an angle other than a right angle.
Cantilever—A beam, bearer, or girder, one end of which is free and the other fixed.
Cap—The crowning member of a pier or column.
Capping—A moulding or group of mouldings on the top of a dado, screen, or gate.
Carcase—The structure of a building before finishings are added.
Castellated—Terminated with battlements.
Catch-pit—A pit formed to collect fluid or solid matter.
Caulking—The stopping of open joints.
Chamfer—See *Bevel*.
Channel—A long sinking formed in the ground or on the surface of any material.
Chisel-pointed — With a flat, broad point.
Cinquefoil—A form of enrichment having five cusps.
Circle on Circle Work—Work circular in elevation as well as on plan.
Clearstory or **Clerestorey**—A range of windows placed high up in a hall or church.
Clear, In the—The net distance between any two points or surfaces.
Clear span—See *Bearing*.
Clerk of Works—An individual appointed to superintend building operations on behalf of the architect.
Coffer—A sunk panel in a ceiling or soffit.
Coin or **Quoin**—The external angle formed by the junction of two walls.
Collar—A ring of metal or other material placed round any object.
Colonnade—A range of columns.
Column—A vertical circular support.
Concavity—The hollow side of a curved line or other object.
Concentric—Circular figures or portions of circles struck from a common centre.
Conduit—A term applied to a channel or pipe used for the conveyance of fluids.
Console—An ornamental bracket used to give real or apparent support to a cornice or other feature.
Convex—The swelling side of a curved line or other object.
Contrary flexure—A curve, part of which is convex and part concave.
Corbel—A projection from a wall to carry any overhanging portion.
Core—The interior, heart, or centre of any object.
Cornice—A group of mouldings crowning a wall or other surface.
Corona—A broad vertical face in a cornice with an overhanging soffit.
Countersinking—A sinking formed in timber or other material to receive the head of a screw or bolt that it may be flush with or below the surface.
Cove—A large hollow moulding generally formed in the cornice of a ceiling.
Crank—A rigid arm fixed at the end of a shaft perpendicular to its axis.
Cresting—An ornamental finishing to a ridge or parapet.
Crib—A stable rack.
Crown—The highest part of an arch or vault.
Crushing Load—The load under which any material loses its power of cohesion.
Culvert—A circular underground channel for conveying fluid.
Cupola—A spherical roof or dome.
Cusps—The points between the foils of a foliated arch.

DADO—The central feature of the pedestal of a column, or a deep band, usually with base and capping at the base of a wall.
Dead load—A permanent load, one which does not move.
Dead shore—A vertical timber strut receiving a dead load only.
Dentils—Square blocks carved out of a projecting fillet.
Detrusion—An outward thrust tending to separate one body from another. A shearing strain acting parallel to the fibres of a material.
Die—Another term for dado. Also a mould from which objects in relief may be struck.
Dome—A convex roof over a circular or polygonal building.
Dominant tenement—In the case of an easement the tenement to which the privilege belongs.
Dormer—A window placed on the inclined plane of a roof the front of which is vertical.
Dressings—Brickwork, terra-cotta or masonry finishings of a superior quality introduced into rougher walling.
Drum—A vertical, circular, or polygonal wall carrying a cupola or the blocks of material composing the shaft of a column.

EAVES—The lowest edges of the inclined sides of a roof projecting beyond the walls.
Elastic limit of any material—The greatest strain that does not produce a permanent set.
Elevation—A geometrical projection representing the outer surface of an object on a perpendicular plane.
Embossing—The raising or forming of any form or design above the surrounding surface.
Engraving—The cutting in or sinking of any form or design below the surrounding surface.
Enriched mouldings are those whose profile is treated with ornament.
Entering angle—The internal angle formed by the intersection of adjacent surfaces.
Entresol—A room formed above another in the general height of a lofty story.
Estimate—The computed cost of any work.

FABRIC—A term applied to the structural portions of buildings.
Façade—The face or front of any building.
False bearing—A column or wall bearing on the unsupported part of a girder.
Fan—An apparatus for mechanically changing or moving air. A hoarding projecting outwards during pulling down.
Fatigue of material—The failure of material under a recurring load which produces a stress exceeding its elastic limit.
Feather edge—A term applied to any thin body having one edge thicker than the other.
Fillet—A narrow flat band.
Finial—The ornamental finishing of a pinnacle, gable, or turret.
Finishings—The various works to complete a building after the shell has been erected.
First floor—The story next above the ground floor, so also with second floor, third floor, etc.
Fixture—An article of a personal nature affixed to land or buildings, whether movable or not.
Flange—A plate projecting from the side or end of a piece of wrought or cast metal.
Flank—The return or side part of a body which joins the front and rear.
Flush—A term signifying the continuity of surface of two bodies joined together.
Flutes—Channels on a vertical shaft.
Foil—The small arcs used in tracery to enrich a larger curve.
Foliated—The use of foils in tracery.
Foundation—The basis, natural or artificial, upon which a superstructure is raised.
Frieze—A broad band, ornamental or otherwise, immediately below a cornice.

GABLE—The vertical triangular end of a sloping roof.
Gablet—A similar feature used as an ornament in buttresses.
Gangway—An open passage-way, temporary or fixed.
Girder—A beam used to support a load over a void.
Girt or Girth—The length of the circumference or profile of an object.
Gradient—The vertical rise in a path or road compared with its length.
Grille—An enclosure formed of crossed bars.
Ground plan—The plan of a building taken at the ground floor level.
Guides—Grooves in which a sliding door or shutter runs.

HALF-LANDING—An intermediate landing in a staircase, extending right across the well-hole.
Half-timber—A structure framed of large timbers, the panels filled in with brick or plaster.
Head-room—The space above a flight of stairs necessary to allow free passage.
Herring-bone work—Blocks of material laid diagonally, the end of each butting against the side of the next block.
Hipped-roof—One in which adjacent sides are inclined and form salient angles.
Hood—A projection to protect an object beneath it from the action of the weather.
Housebreaker—A contractor who pulls down existing buildings and clears away the materials.

IMPOST—The capping of a pier or pilaster that receives an arch.
Incrustation—Material, usually decorative, applied by some connecting medium to another body; or a deposit caused by chemical decomposition.
Inlaid work—Work of which the surface is partly cut away and filled in with other materials.
Intaglio—Ornament sunk below the general surface of a piece of work.
Inverted arch—An arch formed below instead of above its springing line.

JACK—A machine used in building operations to move heavy loads.
Jamb—The vertical sides of an opening in a wall.

KILN—A structure in which materials are calcined or burnt.

LABEL—A projecting drip moulding around an aperture.
Landing—The floor terminating a flight of stairs.
Lateral thrust—The outward force exerted by an arched or framed structure.
Lattice—Open work made by crossing strips of iron or wood.
Level—An instrument used by the carpenter and mason to indicate when a line or surface is parallel with the horizon. (See also **Surveying.**)
Live load—A load consisting of bodies subject to motion.
Loose box—An enclosure within a stable in which a horse can be left loose.

MALLEABLE—Material susceptible of extension under the blows of a hammer.
Market sizes—The sizes in which timber and other materials are stocked and sold.
Mezzanine—A story of small height between two higher ones.
Mitre—A plain joint between two similar pieces of material or mouldings bisecting the angle at which they meet.
Mosaic—An incrustation formed with small cubes of marble, stone, glass, etc.
Moulds—Patterns or contours from which work is wrought. A prepared case into which certain fluid materials are introduced to set or cool, or in which plastic materials are given definite forms.
Mouldings—The ornamental contours given to the projecting or receding edges of materials.

NECKING—Any small moulding near the top of a column or pilaster.
Neutral axis—The plane in a beam at which the stresses change, the effect of the stresses being nothing.

ORIEL—A window similar to a bay corbelled out on an upper story.
Out of winding—Material the surface of which is true and free from twist.
Out to out—A dimension taken to the extreme limits of any body or material.

PANEL—A surface enclosed by a frame and sunk below it; an imitation of such a feature in solid material.
Party wall—A wall used for separating adjoining buildings belonging to different owners.
Party fence wall—A wall standing on lands of adjoining owners as a separation of adjoining lands.
Pedestal—A short pier with base and capping under a column or statue.
Pendant—An ornament suspended below the main part of a structure.
Pendentive—The triangular portion of a truncated hemisphere formed by cutting it with two vertical planes each making an angle of 45° on plan with the end of its lower diameter.
Penstock—A small paddle working in a grooved frame for penning back water.
Penthouse—A shed having a lean-to roof.
Permanent set—A permanent change of form produced in an object due to straining the material beyond its elastic limit.
Piecework—Work paid for by the piece or job—not by time.
Plan—The representation to scale of any horizontal section of an object.
Plinth—A square projecting member at the base of a wall or below a moulded base.
Plotting—The process of laying down on paper to scale the plan, elevation, and section from measurements of an existing building or piece of land.
Plumb—Vertical.
Profile—The actual outline of any moulding or other body as shown by a plane drawn perpendicular to its surface.

QUADRANGLE—A square or rectangular court, generally within a building.
Quarter space landing—A landing in the angle between two flights of stairs making a right angle.

RACKING—The tendency to distort a piece of framing diagonally.
Raking—A member inclined at an angle with the horizontal.
Rampant arch—One whose abutments or springings are at different levels.
Re-entering angle—An angle the plan of which is sunk or returned as opposed to a solid angle.
Relievo or relief—Ornament raised above the surface of a piece of work.
Respond—The abutment of the last arch of an arcade.
Return—The continuation of a surface or moulding round an angle.

SAFE load—The permanent load any material or structure will safely support.
Salient angle—The external angle formed by the intersection of adjacent surfaces.
Scale—A line bearing some definite relation to the full size of an object and subdivided for the purpose of plotting.
Scantling—The dimensions of breadth and thickness in a piece of timber; and of length, breadth and thickness of a stone.
Seating—A carefully prepared bed for some object to rest on.
Section—A geometrical representation of an object or building divided by a vertical plane.
Servient tenement—In the case of an easement the tenement on which the obligation is imposed.
Setting-out rod—A board or boarded surface on which work is set out full size.
Settlements—Failures due to the unequal sinking of parts of a building.
Shoring—Temporary timber supports to a building during alterations or when it shows signs of failure.
Site—The plot of ground on which a structure is to stand.
Soffit—The under surface of a vault, arch, or horizontal member.
Span—The clear distance between the supports of a beam or arch.
Specification—A detailed description of the materials and workmanship to be used for any structure.
Spiral stair—One consisting entirely of winders.
Splay—The inclination of one side of an object obliquely to the adjoining side.
Stop—The finish to a moulding or chamfer.
Story—A complete stage in a building extending from one floor to the next.
Superstructure—The upper part of a building carried in the foundations.

TEMPLATE—A metal mould used for cutting masonry and by plasterers in sticking mouldings.
Tie—A member uniting two bodies having a tendency to diverge.
Tobin ventilator—A tube for introducing external air into a room at a suitable level.
Trammel—An instrument for describing an ellipse.
Transepts—The transverse portions of a cruciform building.
Transom—An intermediate horizontal member of a frame.
Trefoil—An ornament having three cusps.
Turret—A small tower often placed at the angle of a wall.

UNDERPINNING—Temporarily supporting a structure with dead shores; extending an existing wall to a greater depth with new foundations.

VALLEY—The internal angle formed by the meeting of two adjacent sides of a sloping roof.
Vault—The arched roof over an apartment; applied also to a vaulted cellar.
Verandah—A light external open gallery attached to a house, and with a sloping roof.
Verges—The edges of the covering of a roof projecting over a gable-end.

WAGON-HEAD VAULT—A cylindrical vault slightly stilted.
Weathering—The covering or special form given to the upper surface of walls or projections on a building to throw off water falling on it.
Well-hole—The open space in a staircase around which the flights are formed; an opening in a floor below a skylight.
Wings—The side portions of a façade or building subordinate to the principal and central portions.
Working drawings—Drawings showing details of a design and serving as instructions to the several artificers.

EXCAVATING, TIMBERING, SHORING, DRAIN-LAYING

AGRICULTURAL DRAIN—A drain conveying surface water from land.
Asphalte—A natural bituminous substance impervious to water.

BALLAST—Sandy gravel dredged from river beds used for concrete.
Ballast, burnt—Clay dug from excavations and burnt in its natural state.
Barrel drain—One in the form of a hollow cylinder.
Bends—Channels or pipes curved on plan.

CEMENT—A material used for binding together other material and capable of setting without the access of air.
Cement concrete, and mortar—Concrete or mortar the matrix of which consists of cement.
Centre—Temporary frame of wood on which an arch or vault is constructed.
Cesspool—A well formed below the ground to receive sewage.
Chair—Support used in drain laying to raise pipes above concrete bed.
Channel pipe—Pipe of half round section.
Clamp—Rectangular mass of crude bricks stacked for burning.
Clay puddle—Clay tempered with water.
Cleaning eye—An opening in a pipe through which it may be cleansed.
Cleat—Block of timber fixed to any timber to support a strut.
Clinker—A small vitrified brick used for paving.
Coffer dam—A temporary water-tight wall of timber and clay puddle to keep out water during building operations close by.
Concrete—A compound formed of various hard dry materials mixed with lime or cement and water which sets into a solid mass.
Crane—Machine for raising and shifting heavy weights.

DEAD SHORE—Vertical shore carrying a dead load.
Derrick—Form of crane often raised to and used at a great height from the ground.
Derrick stage—Form of gantry to support an elevated derrick.
Disconnecting chamber—Chamber formed in the length of a drain in which the house drain is disconnected from a sewer.
Dog-iron—Iron bar with ends sharpened and bent to right angles for holding together heavy timbers.
Drain—Pipe for the conveyance of sewage and waste water.
Drain-pipes—Cylindrical tubes used to form a drain.

EXCAVATION—A trench, pit, or tunnel dug out below the level of the ground.
Excavator—Labourer who digs and removes earth, etc., to level sites or form trenches, pits, and tunnels.

FENDER—Balk of timber placed outside a gantry to keep carts from damaging the uprights.
Flat centring—Temporary frame of wood on which a flat concrete floor is formed.
Flushing tank—Chamber filled with water and discharged at intervals to cleanse drains.
Flying shore—One placed horizontally across an open space between two buildings.
Fresh air inlet (abbreviation F.A.I.)—Inlet into disconnecting chamber of a drain to admit ventilation.

GANTRY—Temporary erection of squared timbers for dealing with heavy loads.
Granolithic—Species of fine concrete formed with granite chips used for paving and steps.
Gravel—Natural soil composed of small stones and sand.
Grease-trap—Form of trap to receive the discharge from a scullery sink.
Grub up—To break up and clear old foundations, drains, roots, &c., from a site.
Gully—Form of trap to receive waste water from ground surfaces or pipes.

HARD CORE—Hard dry broken rubbish.
Head—In gantries the beam carried by the uprights.
Hoggin—Screenings from pit gravel used for covering paths.
Holdfast—Iron spike with flat head for driving into brickwork.
Hoop-iron—Long flat strips of iron of various widths and gauges.
Horsing—Term used for strutting up centring from a solid base.
Hydraulicity—Capacity of cements and some limes to set without exposure to the air when mixed into a paste with water.

INSPECTION EYE—Opening in a drain or pipe by which it may be examined.
Invert—Lower part of a drain-pipe or sewer.

JUNCTION—Drain-pipe with side inlet for another pipe.
Junction block—Block built into sewer with inlet for drain-pipe.

LAGGINGS—Strips of wood nailed to centres to carry wide arches and vaults.
Lamp hole—Aperture for lowering a light into a drain.
Ledger—In scaffolding the horizontal timber carrying putlogs.
Lime—Material produced by calcining limestones.
Limekiln—Structures in which lime is calcined.
Loam—Soil in which clay prevails.

MADE GROUND—Ground which has been filled in, not virgin soil.
Main drain—Principal drain with which branch drains are connected.
Manhole—Chamber formed in the length of a drain for cleansing and to receive branch drains.
Metalling—Hard material forming the wearing surface of a road.
Monkey—Moving weight used in a pile engine for driving piles.

NEAT CEMENT—Cement used without sand.
Needle—In shoring a timber passed through a wall the ends of which are supported. Also the small timber inserted through wall-piece to receive head of raking shore.

PILES—Long timbers driven into loose ground to support superstructure.
Pile engine—Apparatus for driving in piles.
Plaster of Paris—Material produced by calcining gypsum (*selenite*).
Poling boards—Short boards used in timbering foundations.
Portland cement—Artificial cement of great strength and eminently hydraulic.
Pumice—A light volcanic stone.
Putlogs—Short square timbers used in scaffolding to carry scaffold boards.
Putlog holes—Holes left in brick walls to receive the inner end of putlogs.

QUICKLIME—Material produced by calcining pure limestone.

RAKING SHORE—One making an inclination with the horizon.
Retaining wall—One built to uphold a bank of earth.
Riding shore—One not carried down to the ground, but rising from the back of a raking shore.

SAND—Fine very hard material procured from pits, river beds, and the seashore, may also be crushed from sandstone.
Scaffold—Temporary erection from which permanent walls are constructed.
Scaffold boards—Stout boards with ends bound with hoop-iron, used to form platforms on a scaffold.
Scaffolder—Superior labourer specially engaged in erecting and altering scaffolds.
Scaffold height—Distance between successive ledgers in a scaffold, usually five feet.
Screw pile—Hollow cylindrical iron pile with large projecting screw at its base.
Selenitic lime or cement—One containing a small proportion of sulphate of lime, as plaster of Paris.
Setting—Hardening of a lime or cement mixed into a paste with water.
Sewer—Drain usually under public road to receive drainage of several buildings.
Shoring—The system of propping or strutting a building temporarily with timbers.
Silt—Muddy deposit from rivers.
Slaking—Chemical combination of quicklime with water.
Sleeper—In a gantry the horizontal beam on which the uprights stand.
Socket-pipe—One having socket formed at one end to receive end of next pipe.
Solepiece—Timber on which a system of shores rests.
Spigot end—End of a pipe that fits into socket.
Spoil—Material that has been excavated.
Standards—Vertical posts of a scaffold.
Steening—Brick lining without mortar in a cylindrical well or cesspool.

TAPER PIPE—One of which the diameter is regularly reduced from end to end.
Tar paving—Mixture of tar and shingle used to pave footpaths and areas.
Three-quarter pipe—Pipe of which three quarters of the circumference is formed.
Trap—In drainage a device to prevent the admission of sewer gas into a building while allowing sewage to pass through it.
Traveller—Small crane mounted on rails and able to move to and fro.
Trench—Excavation with parallel sides for the base of a wall or for a drain.
Turning piece—A small centre cut from a thick board on which arches with narrow soffits are constructed.

UPRIGHT—Vertical timbers of a gantry.

WALINGS—Horizontal timbers used in connection with piling and in timbering excavations.
Wall piece—In shoring, a wood plate placed vertically against the wall.
Water seal—Depth to which the upper part of a trap extends below the water standing in it.

BRICKLAYING AND PAVING

AIR BRICK—A brick perforated to admit air into a building.
Air Flue—A conduit for the conveyance of air.
Annular Vault—A vault springing from two circular concentric walls.
Arch—An arrangement of blocks of material in the line of some curve supporting one another by mutual pressure, the outermost blocks resting on or against an abutment.
Architrave—The ornamental band of mouldings run round a door or window opening.
Archivolt—The ornamental band of mouldings worked on the voussoirs of an arch.
Arch Stone—See *voussoir*.
Archway—An arched opening in a building.
Axed Arch—A brick arch of which the bricks are roughly cut into the form of voussoirs.

BACK HEARTH—That part of a hearth within the recess for a fireplace.
Backing—The inner portion of a wall behind the facings.
Backs—Large shallow tanks into which malm earth is run to consolidate.
Bat—Either portion of a brick formed by dividing it across its length.
Batter—A term signifying that the face of a wall is not vertical, but is inclined backwards from its base.
Beam Filling—The filling in of walling between joists or rafters.
Bed—The upper and lower surfaces of a brick or similar block of material.
Bed Timber—The laying of timber plates on a mortar bed.
Bevel—The surface formed by cutting off an arris by a plane; *or*, a tool for setting out surfaces at various angles.
Bird's Mouth—A notch cut in the end of a brick used in bonding obtuse entering angles.
Blades—Loosely built walls of unburnt bricks formed in a kiln for burning.
Blue Brick—A strong, dense brick, dark blue in colour, largely made from Staffordshire clays.
Bolster—A tool used in cutting bricks.
Bond—The arrangement of bricks or stones throughout a wall so that successive courses interlock.
Bonding Iron—A small iron tie used to bind the two parts of a hollow wall.
Breaking Joint—The arrangement of materials so that cross joints in adjacent courses do not coincide.
Breeze—Fine ashes used in burning bricks.
Breeze Bricks—Blocks of breeze concrete the size of an ordinary brick.
Brick—A material produced by burning special forms of clay.
Brick nogging—Brickwork filled in between the timbers of a wood partition.
Brick on Edge—Bricks laid not flat but on edge.
Build-in—Fixing work into a wall as it proceeds.
Bullnose Brick—One having a quadrant curve at one corner.
Bull's Eye—A circular window or opening.
Burrs—Lumps of brick vitrified and run together in burning.

CASING—The covering of the outer face of a wall with another thin substance.
Cement Fillet—A band of cement, the upper surface sloped or weathered.
Chamfer—The surface formed by the cutting of an arris diagonally by a plane.
Chase—A shallow channel cut or formed on a wall face.
Chimney—A conduit for smoke or fumes.
Chimney Bar—An iron bar supporting the arch over a fireplace.
Chimney Bond—A special form of bonding used in chimneys.
Chimney Breast—The side of a chimney or group of chimneys next a room.
Chimney Piece—The fitting, usually ornamental, fixed in front of a fireplace.
Chimney Pot—A tube of terra-cotta or earthenware forming the finish to the top of a chimney.
Chimney Shaft—A large single chimney connected with a furnace or boiler.
Chimney Stack—A structure in which several chimneys are contained.
Chuffs—Bricks on which rain has fallen while burning—soft and useless.
Circular Work—A term applied to any work having a cylindrical face.
Clamp—A carefully-built stack of dried raw bricks for burning.
Closer—A brick cut in half lengthwise.
Coping—The course covering the top of a wall.
Copper—A receptacle for heating water by means of a furnace.
Corbel—A projection from the face of a wall to carry some superstructure.
Corbel Table—A continuous projection carried on corbels or projecting arches.
Core—The heart or centre of a wall; applied also to other objects.
Core and Parge—The operation of finishing the interior surface of a chimney flue.
Cornice—An ornamental course projecting from the face of a wall at or near the top.
Course—A layer of materials contained between two horizontal joints.
Creasing—Courses of tiles set in cement projecting beyond each face of a wall below a brick-on-edge coping.
Crown—The top of an arch or vault.
Cut and Pin-in—Cutting out a part of a wall to receive a step or other object and fixing same in securely.
Cutters—The best malm bricks used for gauged work.
Cylindrical Vault—One in the form of a segment of a cylinder.

DAMP COURSE—A layer of material impervious to moisture introduced into a wall.
Damper—A sliding diaphragm introduced into a flue to regulate the draught.
Dinas Firebrick—The most refractory firebrick made from Glamorganshire fireclay.
Discharging Arch—An arch built over a lintel to relieve it of the weight of the superstructure.
Dry Area—A space constructed outside a wall below the ground level to keep it dry.
Dwarf Wall—One that only rises a short distance from the ground.

EFFLORESCENCE—A floury substance, often occurring on new walls, due to crystallisation of salts in the materials used.
Elliptical Arch—One taking the form of an ellipse.
English Bond—The form in which headers and stretchers appear in alternate courses on the face.
Equilateral Arch—A pointed arch in which the chord subtending each curve equals the width at the springing.
Extrados—The upper surface of any arch.

FACINGS—Material of a selected quality for the face of a wall.
Faircutting—The careful preparation of bricks for special positions.
Fair Face—The face of a brick wall in which both headers and stretchers lie in a true plane.
Feeding Holes—Openings in a kiln to admit fuel.
Fender Wall—One built to carry the hearth of a fireplace.
Fillet—See *cement fillet*.
Firebrick—Bricks formed from refractory clays capable of withstanding high temperatures.
Fireclay—A refractory clay used in setting firebricks.
Fireplace—The place in a room provided for the fire.
Flat Arch—An arch formed with voussoir-shaped bricks, but having a flat soffit.
Flaunching—A weathered surface formed in mortar around a chimney pot.
Flemish Bond—The form in which headers and stretchers appear in the face alternately in every course.
Flue—A conduit for conveying air or smoke.
Flush—One surface is flush with another when they are in the same plane.
Flush-up—A term applied to filling up vertical joints with mortar.
Footings—Courses projecting on either side of the base of a wall to increase its bearing area and stability.
Frenchman—A tool used by a bricklayer in pointing.
Frog—A hollow formed in the face of some bricks.

GANISTER—An extremely refractory sandstone used in a powdered state for lining steel converters.
Gathering-over is causing successive courses of brickwork to overhang those below.
Gauged Brickwork—Work in which large bricks are rubbed down to exact dimensions.
Gault Bricks—Those manufactured from gault clay, usually hard and white.
Glazed Brick—One the face of which is covered with a transparent or opaque glaze.
Grizzles—Inferior soft bricks to which air has had access during burning.
Grout—Mortar or cement made liquid with water and poured into brick walls at intervals to fill up interstices.

HACKS—Long, low banks on which bricks are stacked to dry.
Haunch—The curved sides of an arch between the springing and crown.
Head—The horizontal member forming the top of an opening.
Header—A brick laid in a wall with its length perpendicular to the face.
Header Bond—A bond formed entirely of headers.
Hearth—A slab of incombustible material laid under and in front of a fireplace.
Hod—The receptacle in which a bricklayer's labourer carries mortar or bricks on his shoulder.

Hollow Wall — One in which a continuous cavity is provided between the inner and outer faces.
Honeycomb Wall — One built with intervals between the ends of the bricks.
Hood Mould — A moulding projecting beyond the wall above an opening.
Hoop-iron Bond—Strips of thin iron built into walls longitudinally.
Horseshoe Arch—One consisting of a part of a circle greater than a semicircle.

IMPOST — The top of a pier from which an arch springs.
Intrados—The under surface of any arch.
Inverted Arch—One of which the arch is formed below the level from which it springs.

JAMBS—The vertical sides of a door or window opening.
Jump—An abrupt change in the level of a horizontal course.

KERFS—Heaps of brick earth, dug and covered with fine ashes.
Kiln — A brick structure in which bricks are burnt.
King Closer—A brick cut to a bevel to show a face 2¼ in. wide.

LABOURS—A general term denoting work incidentally necessary, but not specifically described.
Lap — In brickwork, the horizontal distance between vertical joints in successive courses.
Larry — An instrument for mixing mortar.
Limewhite—A mixture of quicklime and water used as a wash.

MALM—A brick earth made in imitation of natural marl.
Marl—A brick earth containing much carbonate of lime.
Mat Sinking—A sunk space formed in the paving inside a door for a mat.
Mortar—The adhesive material formed of lime or cement and sand placed between adjacent bricks.
Mortar Board—A square board on which mortar is deposited on the scaffold.
Mortar Mill—A machine in which mortar is mixed.
Moulded Bricks—Those which have some special moulding on them.
Moulding—The process of forming clay into the form of a brick; also an ornamental contour applied to a surface to enrich it.
Mullion—A vertical pier sub-dividing an opening.
Mural—Appertaining to a wall.

NICHE—A recess formed in the thickness of a wall.
Nogging—See *brick-nogging*.

OBLIQUE ARCH—One in which the face is not perpendicular to the axis.
Offset — A ledge formed in a wall by reducing its thickness.
Oversailing Course—A course which overhangs the course below.

PANEL—A surface enclosed by moulding or other surfaces in different planes.
Parapet—A wall carried up above the level of the adjoining roof.
Parge—The process of rendering the inside of a flue.
Paviors—A hard quality of bricks used for paving.
Perpends—The perpendicular alignment of vertical joints.
Pier—A detached or projecting portion of brickwork or masonry carrying a concentrated load.
Pin-in—Fixing any work into a cavity prepared for it in a wall.
Pin-up—Finishing a new piece of wall tight up against superincumbent work.
Place Bricks — Soft under-burnt bricks, suited only for internal walls.
Plinth—A slight external projection at the base of a structure.
Plumb Rule—The tool with which a bricklayer ensures that walls are built truly vertical.
Pointing—The filling-in with mortar of joints in walling which have been previously raked out.
Pressed Brick—Bricks moulded by dry-clay machinery.
Pugging—A layer of material used to deaden sound.
Pug Mill—The receptacle in which brick earth is worked up before moulding.
Purpose-made Bricks—Those specially formed or moulded for a particular piece of work.

QUEEN CLOSER—A brick of the ordinary length and thickness, but only half the usual width.
Quoin — The external angles of a structure.

RACKING BACK—The end of a wall temporarily formed so that each course is set back by the extent of the lap.
Rake Out—The clearing out of mortar joints previous to pointing or rendering.
Ramp — A curved form connecting a higher and lower part of a wall.
Relieving Arch — See *discharging arch*.
Reveal — The vertical return on the outside of a door or window opening.
Rib — A projecting band, usually moulded, separating adjoining surfaces.
Rod—A standard measure of brickwork equivalent to 272¼ superficial feet of wall one and a half bricks thick.
Rough Arch—One formed with parallel sided bricks and irregular joints.
Rough Cutting—The cutting that may be done to brickwork on the scaffold or in position.
Rubbers—A special class of brick used for rubbed and gauged work.
Rubbing Stone—A gritty stone on which bricks are rubbed.

SAND MOULDING—Sprinkling the mould in brickmaking with sand, to prevent the clay adhering to it.
Scintling—Placing half-dried bricks diagonally at short spaces apart.
Scutch—A tool used for brick cutting.
Segmental Arch—An arch, the intrados of which forms less than a semicircle.
Set-off — A small ledge formed by reducing the thickness of a wall.
Shippers—Sound, hard bricks, not perfect in form, largely exported.
Sill—The horizontal member forming the bottom of an opening.
Skewback — The sloping abutment from which an arch springs.
Sleeper-wall — A low wall carrying the plate or sleeper for a floor.
Slop-moulding—When the mould in brickmaking is dipped in water to prevent the clay adhering to it.
Soil—Very fine ashes that are mixed with brick earth.
Splay Bricks—Those having one angle bevelled.
Splits — Bricks of usual length and breadth, but 1 in., 1½ in., or 2 in. thick.
Springer—The block of material from which an arch rises.
Springing—The horizontal line from which an arch rises.
Square—A tool used for setting out surfaces at right angles.
Squint — A brick used in bonding external obtuse angles.
Stilted Arch—One of which the springing is above the level of the impost.
Stock Board—The loose bottom of a brick mould.
Stocks—Hard, well-burnt bricks not perfect in form.
Stop—The term for the finish of a chamfer or moulding not run out.
Straight Arch—A gauged arch having a horizontal intrados.
Straight Joint—A vertical joint that extends through more than one course.
Stretcher—A brick laid in a wall, its length being parallel to the face of such wall.
Strike—A straight-edge used for removing surplus clay from a brick mould.
String Course—A small continuous horizontal projecting band or moulding.
Struck Joint—A joint with a weathered face, formed as the wall is built.
Surfacing Table—A table on which gauged work is set out.

TEMPERING—A process in preparing clay for brick-making.
Terra-cotta—A hard durable material composed of special clays and burnt in a kiln.
Tessellated Pavement — One composed of small cubes of suitable material.
Tessera—Small cubes of material used in forming mosaic work and tessellated pavements.
Tile Creasing—See *creasing*.
Tin Saw—A saw used for cutting lines into a brick.
Toothing—The end of a wall left with alternate courses projecting one quarter brick, with a view to continuous bonding when extended.
Trowel—The tool used for cutting and laying bricks.
Tuck Pointing—A narrow line of white lime putty worked on the face of ordinary pointing to imitate gauged work.
Tumbling—A method of finishing a sharply-inclined brick surface.

VERTICAL DAMP COURSE—One used in a vertical position in walls, the outer face of which is in contact with the soil.
Voussoir—Each of the wedge-shaped blocks of material of which an arch is formed.

WALL—A structure formed of small component substances used to separate adjoining areas or to enclose spaces.
Wall Tie—The ties of brick, terra-cotta, or metal used to construct the two parts of a hollow wall.
Washing—The process of mixing brick earth with mortar.
Weather Fillet—See *cement fillet*.
Weather Moulding—A moulding having its upper surface formed to throw off water.
White Bricks—Bricks of a whitish colour, largely made in Suffolk.
White Glazed Bricks—A brick with a fine white glazed surface.
Whitewash—A material made from whiting, often applied to brick interiors.
Whiting — A pure chalk ground in water and run through a fine sieve.
Wire-cut—A brick formed in a plastic clay machine.
With or Wythe—The partition separating the flues in a chimney stack.
Wood Brick—A block of wood the size of a brick built into a wall for fixing joinery.

MASONRY AND SLATING

ALABASTER—A very fine grained form of gypsum.
Apex Stone—The stone forming the top of a gable.
Architrave—In columnar architecture, the stone resting directly on the columns.
Architrave Moulding—A group of mouldings running round an opening.
Artificial Stone—A material manufactured in imitation of stone.
Ashlar—Masonry formed with carefully squared stones in regular courses.
Axe—A heavy tool with a chisel edge used in dressing granites.

BACK—Of a slate, the upper surface when laid.
Back-jointed—A rebate formed on the edge of one stone to receive the angle of another stone.
Baluster—A short stone shaft turned and moulded.
Balustrade—A row of balusters with continuous base and capping.
Banker—The bench on which a mason prepares his work.
Barrel Vault—A continuous vault, semicircular in section.
Base Bed—The lowest course of building stone in a Portland quarry.
Bath Stone—An oolitic limestone largely quarried near Bath.
Battlements—An indented parapet, finishing a wall.
Bed of a Slate—The under-surface as laid.
Bevel—A tool of brass or iron for marking irregular angles.
Block—A piece of unwrought stone as quarried.
Block-in-course—A class of masonry built with squared stones.
Blocking Course—A course of squared stones above a cornice.
Boaster—A chisel whose edge is from 1½ to 3 in. broad.
Boasting—Working a masonry surface with a boaster; in carving, cutting the stone roughly to the intended form.
Bond Stones—Stones which penetrate into the backing of a wall to assist bonding.
Boss—A projecting mass of stone at the intersection of moulded ribs, usually carved.
Broached Face—One worked with diagonal furrows produced with a point.
Broad Tool—A chisel about 4 in. wide, used for tooling.

CÆN STONE—A soft, white limestone imported from Normandy.
Cantilever—A shaped bracket of stone or slate, of which one end is pinned into a wall.
Carrara—A white Italian marble, used largely for chimney-pieces.
Centre Nailed—In slating, fixing slates near their centre.
Chalk—A calcareous earth sometimes hard enough for building.
Chilmark—An oolitic limestone found near Tisbury.
Chisel—A tool with a cutting edge from ¼ to 1½ in. broad.
Chiselled Work—A wrought surface left from the chisel.
Claw Tool—One like a broad chisel with teeth on the edge.
Cleavage Plane—The plane in which some rocks readily split.
Countess Slates—Those which measure 20 by 10 in.
Coursed—Built in regular horizontal courses.
Cover Tile—A rounded tile covering the joint of two adjacent tiles in some forms of tiling.
Crab—A form of crane used to lift large stones.
Cramp—A metal bar let into two adjacent stones as a tie.
Crenelations—The openings in an embattled parapet.
Cross-cut Saw—A two-handled, toothed steel saw for cutting soft stones.
Cross Vault—One produced by the intersection of two barrel vaults.
Curb Stones—Those forming a continuous edge, as in a path.
Curtail Step—The lowest step in a flight, with the outer end formed as a scroll.

DIAGONAL RIB—One running between the opposite angles of a rectangular vault.
Diaper-work—The enrichment of a stone surface with small geometrical designs.
Dolomite—A magnesian limestone in which carbonate of magnesia and carbonate of lime occur in equal proportions.
Dovetail Cramps—Slate cramps cut to form a double dovetail.
Dowel—A pin of slate or metal to secure one stone or piece of timber to the stone below it.
Draft—A strip or margin on either side of an arris wrought with a chisel.
Drafted Margin—A draft running round all edges of a stone.
Drag—A broad steel plate with a serrated edge for dressing soft stones.
Dragged Face—A stone face finished with a drag.
Dressed—A term denoting that a stone has been fashioned for its place before fixing.
Drip Stone—A projecting moulding above an opening to throw off water.
Droved Ashlar—A Scotch term for chiselled or random-tooled ashlar.
Duchess Slates—Those measuring 24 by 12 in.

EAVES COURSE—The lowest course of slates or tiles in a roof with eaves.
Embattled—A wall finished at the top with embrasures.
Embrasure—A notch or sinking in the upper edge of a parapet.

FACE—Of a stone, the side exposed when built into a wall.
Face Mould—A pattern giving the form to which a stone face is to be worked.
Feathers—Thin concave pieces of iron used in splitting granite.
Flags—Thin stones used for paving, often laminated.
Flint—Stones formed of nearly pure silica found with chalk.
Flyers—Steps in a flight, the fronts of which are parallel.
Formeret—The vaulting rib that forms the junction between a vault and the arcade wall.
Frame-saw—A large, toothless saw for cutting harder freestones.
Freestone—Any stone capable of being readily tooled.

GALLETING—Inserting small stone chips in broad mortar joints.
Gargoyle—A stone water-shoot, often grotesquely carved.
Gauge—In slated and tiled roofs, the distance from the tail of one slate or tile to the tail of the next.
Geometrical Stair—One formed with radiating steps round an open well-hole.
Glass Tiles—Pieces of glass cut to the form of tiles and laid in a tiled roof to give light.
Granite—An igneous rock composed of quartz mica and felspar.
Grit Stone—A hard sandstone.
Groin—The line formed by the intersection of two vaults at an angle.
Groining Rib—A rib built to support the groin of a vault.
Gypsum—A soft stone formed of hydrated sulphate of lime.

HAMMER DRESSED—Stone that has been dressed with a hammer only.
Heading—The vertical sides of a stone at right angles to the face.
Heading Joint—The joint between the headings of adjacent stones.
Head Nailing—Fixing a slate with nails close to the head.
Head of a Slate—The upper end as laid.
Hearting—The centre part of a wall between the facings.
Hewn Stone—Stone brought to a required form with hammer and chisel.
Hip-tile—A tile of special form used in tiled roofs to form hips.
Hood Moulding—Another term for a dripstone.
Hookstone—A stone which receives the hook or pin of a strap hinge, and is built into a wall or pier.

INTERMEDIATE RIB—One occurring between a diagonal rib and the transverse or wall rib, and springing from the shaft.
Irregular Coursed Rubble—Rubble in which the horizontal beds are not continuous.

JAMBSTONES—Stones used in building the sides of an opening.
Joggle—A joint formed with an indentation in the surface of one stone to receive a projection on the adjoining stone.
Jumper—A long iron chisel used for drilling holes.

KENTISH RAG—A form of compact limestone suitable for rubble work.
Kerb—See *curb*.
Key Course—The course of stones forming the crown of a barrel vault.
Key Stone—The stone forming the crown of an arch.
Knapping—The process of splitting flints for walling.
Kneeler—A square seating worked in certain coping-stones in a raking parapet.

LABEL OR LABEL MOULDING—See *dripstone*.
Lacing Courses—Bonding courses of ashlar or brick used in flint walls.
Ladies—Slates measuring 16 by 8 in.
Laminated—Stones which readily split into thin layers.
Lap—The extent to which the head of one slate or tile is covered by the tail of the next course but one above it.
Lewis—A form of iron wedge used for lifting heavy stones.
Lierne Rib—A short cross-rib in a vault that does not spring from a shaft.
Limestone—A general term for all stones of which the principal ingredient is carbonate of lime.
Lintol—A horizontal beam of stone or timber, spanning a door or window opening.

MALLET—A tool with circular head of hard wood for striking cutting tools.
Marble—Carbonate of lime in a crystalline or semi-crystalline form.
Margin—That part of the back of a tile that is exposed when laid.

Masonry—The art of forming and uniting stones to form walls and other structures.
Millstone Grit—A very hard, coarse-grained sandstone.
Monolith—A column or other object formed of a single stone.
Mortice—A sinking cut into a stone.

NATURAL BED—The bed on which a stone was originally deposited in formation.
Newel—A vertical column or pier placed at the angles of a flight of stairs or forming the centre of a spiral stair.
Nippers—A pair of iron claws used for lifting stones.
Nosing—The salient edge of a step, often moulded.

OBELISK—A lofty pillar, square on plan, and diminished towards the top.
Onyx—A term applied to an Oriental alabaster, and to certain marbles found in Algeria and Mexico.
Oolites—The class of limestone formed of minute egg-shaped grains.
Open Newel Stair—One in which the steps are built in at one end, and with no central newel.

PANTILE.—One that is not flat but undulating in form.
Parian—A white marble, from the Greek island of Paros.
Patent Axe—An axe formed of several strips of steel, each with a cutting edge.
Pentelic Marble—A white marble, from Mount Pentelicus in Greece.
Pick—A heavy hammer-shaped tool with sharp ends.
Pick-Faced—Work that has been dressed with a pick, or in freestones with a point.
Pillar—A disengaged stone column generally irregular in plan.
Pinnacle—A pointed termination at the top of a buttress or gable.
Pitching—The process of knocking off rough lumps from a block.
Pitchings—Cubes of granite used for paving.
Pitching Tool—Resembles a chisel, but has a bevelled not a cutting edge.
Plain Ashlar—Ashlar the surface of which has been rubbed.
Plugs—Circular conical pieces of iron used with *feathers* in splitting granite; also pieces of wood or lead let into stones for fixing joinery.
Point—A tool with a narrow chisel edge used with a mallet.
Polishing—A process by which a smooth, glossy surface is given to marbles and granites.
Polygonal Rubble—A carefully formed rubble wall without horizontal beds.
Porphyry—An igneous rock of a reddish colour found in Egypt; generally any rock containing embedded crystals distinct from the main mass.
Portland Stone—An oolitic limestone largely quarried in the island of Portland.
Princesses—Slates measuring 24 by 14 in.
Punch—A tool with a narrow chisel edge used with a hammer.
Punched Rock Face—A rough face formed with a punch.
Purbeck—A shelly marble found in Dorsetshire.

QUARRY—A place from which any stone or slate is obtained.
Quarry Sap—The moisture contained in all stones when quarried.
Quarry-worked—Stone that is dressed at the quarry before delivery.
Queens—Slates measuring 36 by 24 in.

RADIATING JOINTS—Those which radiate from a common centre.
Raglet—A groove cut in stonework to receive lead flashings.
Random Rubble—Rubble masonry in which all joints are irregular.
Random Tooled—Masonry in which the tool-marks are irregular in direction.
Rib—A narrow arch below the surface of a vault to support or enrich it.
Ridge-rib—A rib forming a division at the top of adjacent severeys.
Ridge-tile—A tile of special form for covering the ridge of a roof.
Ripper—A tool used for cutting old nails in repairing slate roofs.
Riser—The vertical front of a step.
Roach—The topmost bed of Portland stone available for building.
Roestone—An oolite, the grains of which are of large size.
Rouge Royal—A reddish veined marble, found in France and Belgium.
Rubbed Work—Plain work, the face rubbed down with freestone.
Rubble—Masonry built of rough stone not reduced to a uniform size or carefully wrought.
Rusticated Masonry — Masonry formed of large stones, the face left rough and with a drafted margin.
Rustic Quoin—Quoins the edges of which are bevelled so that the face stands in front of the wall face.

SADDLEBACK COPING—A coping, the top of which slopes in two directions.
Saddleback Joint—A joint used on weathered surfaces to prevent water from soaking in.
Sandstones—Those composed of grains of sand cemented together.
Sarking Felt—Felt used for lining roofs.
Scabbling—Consists in shaping blocks roughly by knocking off irregularities.
Scabbling Hammer—A very heavy hammer used in granite work.
Scribe—Incising the outline of a moulding with a sharp pointer.
Sedimentary Rock—Stone that has been deposited by the action of water.
Self-faced—A term applied to slate slabs when used just as split.
Serpentine—A soft, mottled, richly-coloured stone, used for decorative work.
Setting—The process of fixing dressed stones in their position.
Setts or Paving Setts—See *pitchings*.
Severey—A compartment of a vault between two main ribs.
Sicilian Marble—A whitish-veined marble, largely used for lavatory tops.
Sienna Marble—A rich clouded yellow marble found near Sienna, Italy.
Slate—A sedimentary rock that has been subjected to great pressure.
Slating Battens—Strips of deal sawn to sizes, to which slates are nailed.
Slurry—A mixture of stone dust and lime.
Snecks—Small squared stones used in rubble work to square up irregular courses.
Spalling Hammer—A hammer weighing about 12 lb., used for knocking off rough lumps.
Spalls—Rough pieces knocked off large blocks.
Spandril—A space triangular in form; the enclosing lines may be straight or curved.
Spire—The termination of a tower, circular or polygonal, the sides converging to an apex.
Splitters—Small chisels formed with a cup-shaped or hollow end.
Spurstone—A stone, usually of granite, used to protect the lower part of gateways.
Square—A right-angled tool made of iron plate.
Stairs—A series of stone blocks so disposed as to give access from one level to another.
Step—One of the blocks forming stairs.
Stone-cutting—The art of hewing or dressing stones to definite shapes.
Stone Tiles—Large slabs of laminated stones, used as a roofing material.
Stooling—The base to receive a jamb or mullion worked in the same block as the sill.
Straight-edge—A rule whose two edges are parallel.
Stratified—A stone that has been deposited in regular layers or strata.
Stroked Work—Finished like tooling, but tool-marks are formed diagonally.
Summerstone—The lowest stone at the side of a gable which includes the first portion of the coping.

TABLED JOINT—One in which part of the bed of one stone is let into the next course.
Tacks—Strips of metal used to support new slates in repairing a roof.
Tail—The lower end of a slate or tile.
Templet—A block of stone placed in a wall or pier to receive the end of a girder or beam. [*See also* page 311.]
Threshold—A block of stone forming a doorsill flush with the floor.
Throat—A hollow groove under a projecting sill or coping.
Through-stone—A bond stone passing through the whole thickness of a wall.
Tierceron—See *intermediate rib*.
Tilting Fillet—A strip of wood used to raise the bottom or one edge of slates or tiles.
Tisbury Stone—See *chilmark*.
Tooling—Finishing a stone surface so that regular tool-marks are displayed.
Torching—Pointing applied to the underside of slate or tile roofs.
Tracery—The disposition of bars in an arch or window so as to form geometrical designs.
Trammel—A rod, or arrangement of rods, for describing large curves.
Transverse Rib—The one in a vault that runs at right angles to its main axis.
Tread—The upper surface of a step.

UNCOURSED RUBBLE—See *random rubble*.

VALLEY TILE—A tile of special form used in tiled roofs to form valleys.
Venetian Tile—A tile with raised edges used with cover tiles.
Verde-Antique—A mottled green serpentine much used for paving.
Vermiculated Work—A form of rusticated work disposed in lines like the undulations of a worm.
Viscountess Slates—Those which measure 18 by 10 in.

WALL RIB—See *formeret*.
Water Table—A projection with a weathered surface, used in buttresses to throw off water.
Weather Tiling—Vertical tiling hung on walls to protect them.
Whitbed—The bed in a Portland stone quarry next below the roach.
Willesden Paper—A specially prepared rot-proof material used under slating.
Winder—A step in which the tread is wider at one end than the other.

YORK STONE—A hard, laminated sandstone, suited for steps, pavings, and templates, largely quarried in Yorkshire.

ZAX—The tool with which slates are trimmed.

CARPENTRY & CABINET WORK

ADZE—A long-handled tool of the axe type used in heavy carpentry for dressing large pieces of timber. It differs from an axe in several details, but the most noticeable is that the blade is at right angles instead of in line with the handle.

Angle Board—A board with V grooves in which to plane angles, fillets, round rods, etc.

Astragal — A semicircular moulding which projects. When flush with the surface it is a *bead*.

Auger—A long boring tool, usually fitted with a transverse handle like a large gimlet.

Auger Bit—A bit of the auger type used in a brace or machine.

Axe—Used for felling trees and chipping and splitting wood. When small and light it is called a *hatchet*.

BACK SAW—A saw stiffened by a metal back. Tenon and dovetail saws are examples.

Badger Plane—A large rebate plane.

Balk—A squared trunk or log.

Bar Clamp — A clamp the body of which is a bar on which the loose jaw slides.

Barefaced Tenon — A tenon shouldered only on one side and flush on the other.

Batten—A piece of wood screwed or nailed on a surface to give strength, usually to stiffen cross grain or hold boards together.

Baywood — An inferior species of mahogany.

Bead—A small rounded moulding with a quirk on one or both sides.

Bead Plane—A plane with its sole and cutting edge of a form for planing beads.

Beam—A long piece of timber of large section, generally used in a horizontal position for spanning, and supporting weights.

Beaumontague — A stopping composed chiefly of resin and beeswax used for filling holes and defects in cabinet work.

Bench — The table on which woodwork is done. It is provided with a vice and stop.

Bench Hook—A block of wood which fits against the edge of the bench, and is used as a stop for cross-cutting pieces of wood on the bench.

Bench Knife — An appliance sometimes used for holding wood while planing.

Bench Planes—The planes constantly used and kept on the bench. Generally understood to mean the jack, trying, and smoothing planes.

Bench Screw—The name sometimes applied to the vice used for gripping wood at the bench.

Bevel—An adjustable instrument used for testing angles. Angles themselves are also called *bevels* when they are not square.

Birdsmouth — An angle notched out of the end of a piece of timber to enable it to fit on to the angle of another piece.

Bit—Generally a boring tool for use in a brace, but the term includes all cutting tools not permanently attached to their handles.

Block Planes — Small metal planes, generally with the bevel of the cutting edge upwards and the iron lying at a low angle.

Bolection Moulding—Moulding which stands above a surface and fits over an edge.

Bolt—Bolts for wood generally have square nuts and rounded heads, and a square body extending an inch or so from the head to prevent the bolt from turning.

Bow Saw — Also called *frame saw*, or *turning saw*. A narrow saw fitted in a frame which keeps it from bending.

Box Tenon—A tenon sometimes used on the ends of corner posts to fit the mortises of two rails which meet there at right or other angles.

Brace—The appliance used for operating boring bits. Also the term used to signify a strut or bar of any kind for increasing the rigidity of a frame or other structure.

Brad—A variety of small nail, less frequently used than formerly.

Bradawl— The tool used for making very small holes in wood.

Breaking Joint—Arranging end grain joints in alternate positions, as in segmental work.

Bridle Joint — A form of joint in which the end of one member fits over a tongue cut in the body of the other.

Buckle — A saw blade out of truth through being in an unequal state of tension is said to be *buckled*.

Buhl Work — Inlaying with other materials than wood.

Bull-nose Plane—A small metal plane in which the portion of the sole in front of the iron is connected with the body of the plane by being arched over the mouth, and the shavings have to escape at either side.

Butt Hinges — The common type of hinge with square edges intended for sinking into the surface of the wood.

Butt Joint—A joint in which the two connected parts merely abut against each other.

CALLIPERS—An instrument with adjustable arms used chiefly for measuring diameters of circular work where a rule cannot be used.

Camber—The amount of arch given to a horizontal beam to counteract the effect of sagging.

Carcase—The main body of a structure without its minor fittings.

Caul—The piece of metal or wood used for maintaining even pressure on veneer until the glue has set.

Centering, or Centre—The temporary wood structure necessary for building brick, stone, or concrete arches on.

Centre-bit—A bit with a central point which projects into the wood and assists in starting and keeping the bit on the centre required.

Chalk Line—A reel of fine cord used for marking straight chalk lines on surfaces.

Chamfer—The bevelling off of square corners. The term is applied both to the operation of chamfering and to the angle or chamfer itself.

Chariot Plane—A small metal plane with wood wedge and deeper front than a block plane.

Chase Mortise—A mortise made long enough to permit the insertion of a member which cannot be put directly in from the front. The extra length is afterwards filled up.

Check—Another name for a rebate or shoulder.

Chisel—A long, narrow, flat cutting tool sharpened at its end.

Chuck—A lathe accessory for securing work to the mandrel.

Circular Saw—A machine saw in the form of a circular plate.

Clamp, or Cramp—An appliance for holding parts together by pressure. Also the act of clamping.

Cleading—Timbering of a shaft, mine, or cylinder.

Cleat—A wood clamp which, in addition to squeezing together, keeps a surface from warping. The term is also often used in the same sense as batten, but generally means a solid attachment to which some other part can be connected.

Clinch, or Clench—The bending over of the protruding point of a nail.

Coach Screw—A large screw for wood provided with a square head on which a spanner is used.

Cofferdam—A watertight enclosure of piles and boarding under water. It is a temporary construction to facilitate the laying of foundations and supports for bridges and piers.

Compasses — Instruments used for dividing and for describing circles and curves up to about 8 in. radius. They are of metal, and generally provided with a wing and pinching screw.

Compass Saw — A saw for cutting sweeps. It resembles a keyhole saw, except that it is larger, and has a handle of the tenon saw type.

Cornice—The top horizontal moulding of any structure.

Countersink—To sink the head of a screw flush with or below the surface. Also the name of a bit for enlarging the hole for the purpose.

Cramp—See *clamp*.

Cross-cut Saw—A saw intended for cutting across grain. Unless otherwise specified, a large two-handled saw is meant.

Cup Chuck, or Bell Chuck—A lathe chuck bearing some resemblance to a cup or bell. Short lengths of wood are chucked by having an end driven tightly into it.

DEAL—The various kinds of pine are commonly called deal. Also, 3-in. boards 9 or 10 in. wide.

Dividers — Small compasses used either for dividing or for striking circles.

Dog—A staple used for temporarily holding pieces of wood together, generally while glue is setting.

Double Tenon—Two tenons running side by side in separate planes.

Dovetail—A form of interlocking joint often employed when ends of wood meet at right angles.

Dovetail Saw—A fine saw for cutting dovetails.

Dowels — Hardwood pins used in edge joints and for numerous other purposes.

Draw Bore Pin—A metal pin used for drawing mortise and tenon joints together.

Drawer Lock Chisel—A bent chisel for working in confined situations.

Draw Knife —A large knife with a handle at each end.

Dress—To plane the surface of a piece of wood true is to dress it.

Dry Rot—A disease of timber generally brought about by want of ventilation and dampness.

ELEVATION—In a drawing, the front view of an object. If specified as side elevation, end elevation, or sectional elevation, the points of view vary accordingly, but they are always taken in a vertical plane with the object standing in its normal position.

End Grain—A face of a piece of wood which exposes the ends of the fibres.

Expansion Bit, or Extension Bit—A bit which can be adjusted to bore holes of different diameters.

FACE MARK—A mark put on one face of a piece of wood to indicate its intended position, or that it has been planed true.

Face Plate — The flat plate chuck of a lathe.
Fanlight — A sash over a door or window.
Fence—The guide used on saw tables, jointing, and other machines.
Fillet—Plain hollowed moulding occupying interior angles.
Fillister — A rebate plane provided with a guide.
Finish—The cleaning up, smoothing, varnishing, and polishing operations that follow the actual construction of anything.
Firmer Gouges and Chisels—Are those used for ordinary work. In stoutness they come midway between paring and mortise tools.
Fished Joint—A butt joint held together by fish-plates.
Float—A file with extremely coarse teeth cut on one face.
Flush—Contiguous surfaces that are level with each other or on the same plane.
Flutes—A number of hollow fillets side by side, generally round a column.
Fork Centre—The pronged chuck of a lathe.
Fox Wedging — A stub mortise and tenon joint in which wedges are inserted in the act of driving in.
French Polish—Shellac varnish applied with a rubber.
Fret Saw — An extremely narrow saw with fine teeth used for sawing ornamental designs in thin wood.

GAUGE—Used for marking lines on a surface parallel with one of the edges.
Getting Out—To get out wood is to saw out and prepare ready for putting together the pieces required for a job.
Gimlet — A small boring tool with screw point and a transverse handle.
Glasspaper—Paper coated with powdered glass or flint. Also called *Sandpaper*.
Glue—An animal substance used to cement pieces of wood together.
Glue Pot—The receptacle in which glue is melted for use. It consists of an inner pot for the glue and an outer one for water.
Gouge—A gouge differs from a chisel in being curved in cross section instead of flat.
Grain—The fibres of wood are collectively called the *grain*, and the direction in which they run is called the *direction of the grain*.
Grindstone—A revolving stone for removing material from cutting tools preparatory to sharpening them on a stone of finer grain.
Gullet — In large circular and some other saws there is some amount of space between the bases of the teeth, and this is known as the *gullet*.

HALF LAP JOINT—Also *halved* joint, or *lap* joint. A lap joint in which half the thickness of each piece is cut away so that the combined thickness at the joint is no more than that of each single piece.
Half Rip Saw—A saw used for ripping, but which has smaller teeth than a regular rip saw.
Hand Saw—A saw intended primarily for cross-cutting, but used for general purposes. It has smaller teeth than saws for ripping.
Hand Screw—A wooden clamp consisting of two jaws operated by two long screws with handles at their ends.
Hardwood—The wood obtained from the broad-leaved varieties of trees.
Hatchet—See *axe*.
Haunched Tenon—A tenon reduced in width either for a portion or the whole of its length. Employed when there is an objection to cutting a full-width mortise.
Heading Joint—A butt joint between two lengths of timber whose ends meet on a joist.
Headstock — The part of a lathe carrying the mandrel which imparts rotary movement to the work.
Herringbone Strutting—The short crossed stays between floor joists.
Hinge — The means of attachment which permits doors and box covers to swing or fold.
Holdfast — An appliance used for holding work down on the bench.
Holding Up—Being large enough to finish to required dimensions.
Hollow Plane—A plane with rounded sole for planing hollows.
Hone — Also *oilstone*. A stone used for sharpening cutting tools.
Housing—A structure which encloses something. A joint in which the end of one member is enclosed in the other without being reduced to a tenon.

INLAY — Ornamental designs of a material let into the surface of another material.
Iron—The cutter of a plane or of any tool or machine in which it is detachable.

JACK PLANE—The plane used for roughing down a surface approximately true.
Jointer — A small planing machine which cannot be set to plane to a thickness. Also a hand plane of greater length than the trying plane.
Joists—The timbers on which flooring boards are laid.

KERF—The cut or space a saw makes in passing through wood.
Key—A term with several applications, but its general meaning is a small piece of wood inserted in joints to hold them together or across grain to prevent curvature.
Keyhole Saw — Also *pad saw*. A small saw suitable for cutting keyholes or curves.
King Post—The main central post of a truss.
Knot—A hard spot of timber due to a change in the fibres caused by a branch of the tree springing from there.

LAGS—Strips used for building up cylindrical bodies and boarding over ribs of centring. Also called *lagging* or *staves*.
Lathe—The machine used for woodturning.
Ledged Door—A rough door formed of boards held together by battens or ledges.
Level — An appliance used for testing the horizontal accuracy of surfaces. Also called a *spirit level*.
Lintel — The beam which supports the brickwork or masonry over an opening in a wall.
Lock Corners—A term applied chiefly to the corners of boxes made by machinery. They differ from dovetails in being parallel.
Long Tooth Gauge—A gauge used for marking lines on surfaces at a different level to the edge which guides the stock.

MALLET — A large-headed wood hammer used chiefly for driving chisels and gouges.
Mansard Roof—A roof with two different slopes. Also called *curb roof*.
Marking Out—Drawing either on a board or on the material itself the size and shape of anything that is to be made. Also called *laying out* or *setting out*.
Matchboards—Boards with a groove in one edge and a tongue on the other, so that a number of them will fit edge to edge.
Mitre—An angle joint between two pieces meeting at right angles, as in picture-frames.
Mitre Clamp—A clamp for holding mitre joints together temporarily.
Mitre Dovetails—Secret dovetails cut in a mitre joint.
Mitre Shooting Board—A shooting board for planing mitres.
Mitre Block—A block with saw cut or grooves to guide the saw in cutting mitres.
Mitre Box—A box open at the top and ends and having saw cuts in the sides to guide the saw in cutting pieces laid in the box.
Mortise — The slot or recess which receives a tenon.
Mortise Chisel—A very stout form of chisel used for mortises.
Mortise Gauge—A gauge with two marking points adjustable in relation to each other.
Muntins—The vertical dividing bars in a window, door, or other frame.

NEEDLES—Supports for scaffolding inserted in walls.
Needle Points—A kind of needle without an eye used in cabinet work in place of fine nails.
Newels—The main posts which support the handrails of stairs.

OGEE —A moulding consisting of a concave and convex sweep dying into each other.
Oilstone—The stone used for sharpening tools. So called because it is used with oil on its surface.
Ovolo — A round moulding of about a quarter of a circle, but sometimes elliptic in form.

PAD SAW—A narrow saw held by pinching screws in a slotted handle long enough to enclose the saw when not in use. Also called *keyhole saw*.
Pair of Tenons—Tenons in line with each other. Not the same as double tenons.
Panel — A sheet of thin wood used for filling the open area in a frame.
Panel Gauge—A gauge long enough to include about 18 in. or 2 ft.
Panel Saw—A small type of hand saw used for light work on the bench.
Paring Tools—Long, thin gouges and chisels intended for paring without the use of a mallet.
Parquetry—Flooring made by laying hardwood blocks in various geometrical patterns.
Piles—Large wood posts driven into the ground.
Pincers—A gripping tool for withdrawing nails.
Pinned Joint—A joint in which pins or pegs are driven through to assist in holding the parts together.
Pitch — The inclination of a roof or stairway. It is known as *high* or *low* pitch according to the degree of slope. Also the height of an arch.
Plan — A view looking down on top of an object.
Plane—A cutter carried in some form of block which compels it to cut a thin uniform shaving.
Plane Iron—The cutter of a plane.
Pliers — Narrow-jawed pincers of various kinds employed for bending wire and for numerous other purposes.
Plough — A plane for cutting the grooves for panels and tongued joints.
Plumb—Being in line vertically.
Plumb Bob—A weighted string, sometimes in connection with a straightedge, used for testing the vertical accuracy of work. Also called a *plumb line*.
Poppet—The adjustable back centre of a lathe. Also called *tailstock*.
Punch — A steel pin used in driving nails below the surface.
Purlins—Members which unite the trusses of roofs in longitudinal directions.

QUARTERING—The bars or strips produced by ripping deals into four pieces.

Queen Post—Distinguished from king post chiefly by not being in the central position under a roof.

Quirk—The narrow groove or furrow at the side of a bead.

RAFTERS—The timbers to which the covering of a roof is attached.

Rail—A horizontal bar.

Raised Panel — A panel reduced in thickness at its edges.

Rasp—A species of coarse file used for wood.

Ratchet Brace — A brace with an arrangement which permits it to be worked in an arc of a circle and at the same time to turn the bit only in the forward direction.

Rebate—Or *rabbet*—A shallow channel or wide groove or recess planed in a surface.

Rebate Plane—A plane whose sole is no wider than the iron.

Rest—The arrangement on which the tool rests in a lathe.

Riffler—A small double-ended bent file or rasp.

Rip Saw—A saw with large teeth, intended for cutting in the direction of the grain.

Round Nose—A chisel used for scraping hollows in turned work in the lathe.

Round Plane—The reverse of a *hollow plane.*

Router — A small plane in which the iron may be set to cut to a certain depth below the sole. It is used for clearing out small recesses to a definite depth.

Rubber—The piece of cork or wood on which glasspaper is generally wrapped when in use.

SAG—The sinking of the middle part of a piece of timber which is supported at its ends.

Sandpaper—See *glasspaper.*

Sash—A frame in which panes of glass are fitted.

Sash Bars—The dividing bars which separate panes of glass in a sash.

Sash Door—A door with glass in its upper part.

Sash Plane — A plane to suit the mouldings of sash bars.

Saw Set—Any appliance used for setting or bending the teeth of saws sideways.

Saw Stool—A low heavy trestle used for resting planks on when sawing.

Scaffold—The temporary wood structure necessary in erecting buildings.

Scantling—A term used to signify the width of a piece of timber. It also means pieces of irregular width and thickness.

Scarf Joint — A lap joint used for joining two pieces of timber end to end to make one long piece.

Scotia — A concave moulding which increases in radius in its lower part. Also called *trochilus.*

Scraper—A small piece of sheet steel used for scraping the surfaces of hard wood smooth.

Screws—The threaded metal pins used for holding woodwork together. Also called *wood screws* or *screw nails.*

Screwdriver—A tool which fits the slots of screw heads, and is used for turning them. Also called a *turnscrew.*

Screwdriver Bit—A brace bit used for turning screws.

Scriber—A steel instrument for inscribing lines on wood. Also called *striking knife.*

Seasoned Timber — Timber from which the sap has been dried out.

Segments—Short sweeps used for building up circles or portions of circles.

Set — The set of a saw is the amount to which the teeth are alternately bent to opposite sides.

Set Square—A triangular square used for testing interior angles.

Shake—A longitudinal crack in timber.

Shank—The portion of a tool which connects with the handle, or fits the socket of a brace or machine.

Shell Bit—A bit used for screw holes. Its body is a channel of crescent-shaped section, and is sharpened at the end.

Shooting—Planing the edge of a piece of wood straight.

Shooting Board—A board for planing pieces of wood on.

Short Grain — When the distance across the grain is greater than the longitudinal dimension, the grain may be said to be *short.*

Shoulder—A step, or change of level in a surface, for another part to bear against.

Side Chisel—A chisel used at the lathe for parting, and numerous other purposes. Also called *side tool* or *turning chisel.*

Single Iron—A plane iron used without a back iron.

Skew—Anything set obliquely or at an angle to something else. In skew-mouthed planes, the cutting edge is out of square with the body of the plane.

Skew Nailed—Nails driven in at an angle at the feet of posts, and in similar circumstances. Also called *toe nailed* or *tusk nailed.*

Slip — A small piece of oilstone used in the hand.

Slip, or Slot Mortise—A mortise that is open at the end of the wood as well as going through from one face to the other.

Smoothing Plane—A short plane used for smoothing surfaces.

Socket Chisels and Gouges—Stout chisels and gouges formed into a socket at the shank end into which the wood handle is driven.

Sole, or Sole Piece—The piece of wood used as a base on which to rest the ends of posts or uprights.

Splice Joint—A *scarf joint.*

Spokeshave—A tool consisting of a knife set in a body or guide, provided with a handle at each end.

Sprigs—Small nails with very small heads.

Spring Dividers — Dividers which spring open as the wing nut is run back, and keep to the largest extension the position of the nut permits.

Staple — A piece of U-shaped iron, with pointed ends. A modified form for holding joints is called a *dog.*

Stile—The vertical side pieces of a door or other frame.

Stop — The block or catch near the front end of a bench against which the wood presses when being planed. Also the shoulder which stops a door or drawer.

Stop Chamfer — A chamfer which finishes short of the extreme point it could be carried to.

Stopping—Any plastic material used for filling small holes in order to make an unbroken surface.

Straightedge—A long piece of wood or other material with a perfectly straight edge, used for testing the accuracy of flat surfaces.

Strap — A bar of iron of rectangular section used for binding timbers together at their joints.

Strut—A stay, brace, bar, or support in compression in a diagonal position.

Stub Tenon—A short tenon which does not go through the part into which it fits.

Studs, or Studding — The vertical bars in lath and plaster partitions.

Stuff — A common shop term for timber.

Stump Tenon—A tenon made thick for a short distance from its root and thin the remainder of its length. The term is also used for *stub tenon.*

Sweep — The term is applicable to almost all curved portions of work, or pieces of wood, when the radius is not very small.

TANG—The pointed shank of a tool which is driven into the wood handle.

Templet, or Template — A pattern, generally in the form of a thin sheet of material, from which the shape of the actual work is marked or tested.

Tenon—The shouldered down end of a piece of wood which fits into the mortise or socket of another piece.

Thumb Plane—A very small plane of the smoothing plane type.

Toe Nailed—See *skew nailed.*

Tongue—A projecting ridge which fits into a groove in an adjoining piece.

Toothing Plane—A plane with a serrated iron, used in preparing surfaces for veneer.

Torus—A large bead with a fillet.

Trammels—An instrument for marking circles and curves of larger radius than ordinary compasses.

Trestles—Light supports consisting of four spreading legs and a narrow top, used for resting planks or work on.

Trimmer—A shearing machine for wood. Also a beam supporting the ends of joists.

Trochilus—See *scotia.*

True — Surfaces that are straight, level, or accurately formed to the shape required, or square, or concentric with each other, are said to be *true.* When not so, they are out of truth.

Truss—The stiffening of a horizontal beam by braces, which convert it into a rigid angular frame.

Trying Plane—A large plane which generally follows the jack plane for finishing and making surfaces true.

Try Square — An ordinary square, consisting of a stock and blade, used for testing the accuracy of work.

Turning Chisel—See *side chisel.*

Turnscrew—See *screwdriver.*

Tusk Nailed—See *skew nailed.*

Tusk Tenon—A tenon with a stump or tusk at the root.

Twist Bit—A bit with a spiral body.

UNDERCUT—A shoulder or similar part which overhangs, or has more cut away from its base than from its upper part.

VARNISH—A resin or gum dissolved in a suitable liquid.

Veneer—Very thin fancy wood glued on to the surface of an article constructed of cheaper wood.

Veneering Hammer — A hammer with a very wide edge, used squeegee fashion on veneer, instead of using cauls.

Vice, or Vise—An appliance attached to the bench and used for gripping.

WARPING—The twisting or springing of wood caused by unequal shrinkage. The term generally means an actual twist or wind, but sometimes is used when only curvature is meant.

Whet—To sharpen a tool on a hone.

Winding—The twist, or cast, or wind that sometimes develops in large pieces of wood.

Winding Strips—Parallel strips used for detecting the amount of twist in the surface of long pieces of wood.

Wing Compasses — Compasses with an arm and pinching screw for holding the legs at a fixed distance apart.

Wire Nails—Nails made with parallel bodies in great variety, and now the most commonly used kind of nail.

Wood Screw — The kind of screw commonly used for woodwork.

BUILDERS' FINISHING TERMS

AIR COCK—A tap to allow of the escape of air.
Anaglypta—A wall-covering modelled in relief.
Anchor Plate—A plate built into a wall to hold down some object.
Angus Smith's Solution—A preservative solution used for iron pipes.
Anti-syphon Pipe—An air pipe to counteract the tendency of traps to syphon out.
Apron—A strip of lead placed below a window, chimney, etc., and dressed on to the roof covering.
Arabesque Glass—A form of rolled glass with an ornamental pattern.
Axle Pulley—A pulley arranged in a vertical plate used in hanging sashes.
Automatic Flushing Cistern—A cistern arranged to discharge its contents as soon as it is filled.

BACK PUTTY—The putty placed between a pane of glass and the rebate of the sash.
Balance Weight—A weight used in sash frames to counterbalance the frame.
Barff's Process—A method of protecting iron by forming a coating of black oxide.
Bases—Those pigments which give opacity and body to paints.
Bastard Flatting—A flatting coat to which a little clarified oil or size has been added.
Bearing Plate—An iron plate used between a strap and a piece of timber.
Bell Board—A board on which a series of bells are attached.
Bib-cock—A form of cock which delivers water from the end of a pipe.
Blister—In painted work small parts of the paint that have become separated from the surface covered and raised.
Blown Joint—A soldered lead joint made with a blowpipe.
Bobbins—Boxwood balls used in bending lead pipes.
Bolt—A curved piece of wood used in bending lead pipes; a metal fastening for a door catching in a staple or thimble.
Boot Boiler—A form of boiler used at the back of a kitchen range.
Box Girder—A girder having two parallel webs.
Bracketing—Piece of wood to receive lathes for plaster cornices.
Brad—A small nail with a head on one side only.
Brazing—The joining two pieces of metal by means of brass solder.
Bringing Forward—Painting portions of work one or more extra coats before general painting.
British Plate—Plate glass cast and afterwards polished.
Brunswick Black—A material formed of asphaltum and turpentine and applied to iron.
Bulb Iron—Iron rolled with one flat and one cylindrical flange.
Bullet Latch—A latch formed with a spherical catch like a bullet.
Bullion—The centre of a sheet of crown glass.
Burlap—A woven material formed of jute.
Burning Off—Removing paint by applying heat to the surface.
Burning In—Melting solder to fit lead in a raglet.
Burnt Joint—A lead joint formed with lead in place of solder.
CABIN HOOK—A freely-moving hook attached to a staple or plate.
Calcothar—Red oxide of iron.
Cames—Strips of lead having an H section used in lead glazing.
Cantilever—A beam built into a wall and supported at one end only.
Casement Fastener—A metal fastener to secure a casement to the frame.
Cast Iron—Iron that has been melted and cast in a mould.
Cathedral Glass—Plain, tinted glass used in lead glazing.
Cat Ladder—Light iron ladders used for giving access to roofs.
Ceiling Block—A block of wood used for attaching a gas pendant to a ceiling.
Cesspool—A sunk outlet to a lead gutter.
Chimney Bar—A wrought-iron bar built in under the arch of a chimney opening.
Chequer Plate—An iron plate with a raised chequered surface.
Circulating Pipe—A pipe through which hot water from a boiler is circulated.
Cleaning Eye—An opening inserted in pipes and traps to facilitate cleaning.
Clearcolle—Thin liquid glue used on porous surfaces before whitewash.
Clips—Metal bands placed round a pipe to fix same to woodwork.
Clout Nails—Flat-headed nails.
Coach Screw—A long screw of uniform diameter and with a square head.
Coarse Stuff—A mixture of lime, sand and hair for first two coats in plastering.
Cobweb Grating—A form of grating used as outlet to lavatory basins.
Coburg Varnish—A pale oil varnish.
Cockle Furnace—A furnace of thick iron used for heating air.
Collar—A lead disc temporarily fixed round a pipe during wiping a joint to catch the superfluous solder.
Coil—A pipe bent to and fro to give a large heating surface at any desired point.
Compo—A general term given to cement used for coating brickwork.
Composition Nails—Nails made of various alloys to avoid corrosion.
Concrete Float—A thick, heavy float used in finishing concrete paving.
Copper Bit Joint—A soldered joint made with a copper bit.
Copper Nails—Nails made of copper, usually in the form of clout nails.
Core—A thick iron bar fitted under a handrail; the rough centre for a plaster moulding.
Cottar—Wedge-shaped keys.
Countersunk Joint—One finished with a splayed head flush with the plate.
Cover Flashing—A strip of lead fixed into a wall and covering the top of a flashing.
Creeping—The slow movement of lead downwards on a steep roof.
Cross-garnet Hinge—A hinge in the form of a ⊢.
Crown Glass—Glass blown in globular form and afterwards flattened.
Crystal Glass—A very pure white quality of sheet or plate glass.
Cup-and-ball Joint—A joint giving free rotary motion, used for chandeliers.
Cups—Small brass cones fitted into wood beads to receive the heads of screws.
Cutting Wheel—A circular knife used in trimming wallpapers.

DADO—A horizontal division at the base of a wall.
Darby—A two-handled plasterer's float.
Dead Lock—A lock having only one bolt operated by a key.
Dished—A slightly hollowed bottom formed in lead-lined sinks and cesspools.
Distemper—A material similar to whitewash, but mixed with colouring pigment.
Double-arm Pendant—A form of gas pendant having two arms.
Double Laths—Laths of extra thickness.
Double Size—Size of twice the usual strength.
Double-swing Bracket—A gas bracket having two arms, both with movable joints.
Dovetail Lathing—A sheet of metal bent into a series of dovetail grooves.
Draw-off—A tap by means of which water may be drawn from a pipe.
Drawn Pipes—Lead pipes produced by machinery without any joint.
Drip—An abrupt change in the level of a lead flat.
Drip Pipe—A pipe used in steam heating systems to get rid of condensation water.
Drop Handle—A handle which is hinged to lie close against a door when not in use.
Dryers—Substances added to paint to assist the absorption of oxygen.
D Trap—An old form of trap, shaped like a ⌂.
Dubbing Out—The process of forming a core for plaster mouldings.
Dummy—A tool used by the plumber in pipe bending.
EARS—Flat projections cast on iron rain-water pipes for fixing them.
Eaves Gutter—A gutter to take rain-water fixed at the eaves.
Economiser—A metal shield to close the opening between a grate and the hearth.
Elbow—A socket joining two pipes at right angles.
Embossed Glass—Glass that has been ornamented by chemical process.
Escutcheon—A small shield placed round a keyhole opening.
Espagnolette Bolt—A long double-action bolt used to secure French windows.
Eye—A metal ring into which a bolt may be fitted.
Eye-plate—A plate by which an eye may be attached to woodwork.
Expanded Metal—Metal sheets perforated and drawn out to form a kind of netting.
Expansion Joint—A form of joint allowing of movement due to expansion.
Expansion Pipe—A pipe in a hot-water system to carry off or contain excess of water due to expansion.
Expansion Tank—A tank in a hot-water system to hold excess of water due to expansion.

FALL-DOWN STOP—A form of gate stop that is lowered when not in use.
Feather-edge Rule—A rule one edge of which is splayed off to a thin edge.
Feed Cistern—A small cistern to keep a boiler supplied with water.
Fine Stuff—A mixture of lime putty with a little sand and hair.
Finger Plate—A plate fixed to either face of a door above or below a lock.
Finial—An ornamental termination to a gable or hip.
Fining Float—Small float for working plaster mitres, etc.
Fire-bar—The horizontal bars which carry the fire in a grate, boiler, etc.
Fish-plate—An iron plate used in forming a fished joint.
Flake White—A form of pure white lead made in England.
Flange—The tension and compression members in an iron girder.
Flanged Joint—A lead joint formed with a flange below it to support the pipe on a floor.
Flashed Glass—White glass with a film of coloured glass overlaid.
Flashing—A strip of lead used to make watertight the joint between a sloping roof and a vertical face.
Flatting—A coat of paint that is finished without gloss.
Flitch—An iron plate placed vertically in a flitched beam.
Float—A flat wooden instrument for working the final coat in plastering.
Floating Rule—A long rule used in forming screeds and floating surfaces between screeds.
Floor Spring—A spring for automatically closing a door, fixed in the floor.

Flow Pipe—That portionof a circulating pipe from the boiler to the highest level.
Flush Bolt—A bolt let into a door or window so that the face is flush with the wood.
Flush Handle—A handle sunk into a door so as to be flush with its face.
Flushing Tank—A tank the whole contents of which are discharged at one time.
Fluted Sheet—Sheet glass rolled with ribbed rollers, producing flutes.
Foil—Thin leaves of copper and other metals, applied like gold leaf.
French Nails—Long thin wire nails with flat heads.
French Polish—A mixture of shellac and spirits of wine for polishing hard woods.

GALVANISED IRON—Iron covered with a coating of zinc.
Gasket—Strands of rope or cord driven into the joints of pipes.
Gas Tar—See *coal tar*.
Gauge—A measure of thickness of wire and metal; to mix materials in exact proportion with water.
Gauge Board—A board on which plasterers' materials are mixed.
Gauged Stuff—Coarse or fine stuff with which plaster of Paris is mixed.
Gauge Hook—A tool used by plumbers for shaving lead surfaces.
Gauge Rule—a rule used for forming sunk or raised plaster surfaces.
Gauging Trowel—A trowel used for gauging plasterers' stuff.
Gelatine Mould—Moulds formed of gelatine for casting plaster enrichments.
Gib—A bearing iron used in connection with cottars.
Gilding—A process of applying gold leaf to surfaces.
Glaziers' Putty—A mixture of whiting and linseed oil.
Gold Size—A material applied to surfaces to be gilded.
Governor—An automatic control to regulate the pressure of gas in buildings.
Grainers' Comb—A metal comb used to produce graining.
Graining—Finishing a painted surface to match the grain of wood.
Ground Brush—The brush used by painters for large surfaces.
Ground Glass—Glass the surface of which is rendered obscure by grinding.
Gudgeon—The term applied to the eye of a hinge.
Gutter Pipe—The pipe through which the contents of a gutter are discharged.

HACKING OFF—The process of removing old plaster.
Hacking Out—The process of removing broken glass and old putty.
Hair—In plastering, the long hair from the backs of oxen.
Hand Float—Small floats, usually of pine, used in plastering.
Hangers—The struts employed in trussing a timber beam.
Hasp—A hinged, slotted plate passed over a staple and secured with a pin or padlock.
Hawk—A small board with a handle used for gauging and holding plasterers' stuff.
Heel—In pipe bending, the outer side of the curve.
Hit-and-miss Grating—One of which the openings can be closed by sliding a perforated plate.
H-Iron—Iron rolled so as to have an H section.
Holding-down Bolt—A bolt used to secure any object to an anchor plate.
Hopper Closet—A closet in the form of a funnel.
Hydrant—A stand pipe to which a hose may be attached.

INGRAIN PAPER—Papers coloured throughout in their manufacture.

JAPAN—Lead paint mixed with varnish dried at a high temperature.
Japanese Gold Size—A preparation of gum anime and linseed oil.
Jhilmil—A form of metal lathing.

KEEN'S CEMENT—A preparation of plaster of Paris treated with alum.
Keying—The scoring of the surface of plaster to secure adhesion for the next coat.
Kicking Plate—A metal plate fixed to the bottom rail of a door.
Killed Spirit—Spirits of salts in which zinc has been dissolved.
King Bolt—An iron bolt taking the place of a king post in a compound truss.
Knotting—The process of killing or covering knots in woodwork before painting.
Knuckle—The projecting portion of a hinge through which the pin passes.

LAC—A resinous substance obtained from the East Indies.
Lacquer—A varnish made with methylated spirit.
Lapped Joint—In lead work a joint in which one sheet is covered by the edge of the next.
Larry—A rake used for mixing hair with coarse stuff.
Latch—A fastening which may be opened with a handle instead of a key.
Lath and a Half—A term applied to extra stout laths.
Laths—Thin strips of wood used as a groundwork for plastering.
Lattice Girder—A girder of which the web is formed of iron lattice work.
Laying—Another term for rendering in plaster work.
Laying Trowel—A large square trowel used in rendering.
Lead Lights—Lights formed of small panes connected by lead cames.
Lead Safe—A tray of lead formed to catch any overflow water.
Levelling Rule—A rule used by plasterers in levelling ceilings.
Lignomur—A wall-hanging formed of wood fibre.
Lime and Hair—Another term for coarse stuff.
Lime Plaster—A term signifying that plaster is formed with lime.
Lime Putty—Pure lime run with water and allowed to settle.
Lime White—Chalk lime mixed with an excess of water, used as a wash.
Lincrusta Walton—A wall decoration executed in relief.
Litharge—Another term for oxide of lead.
Luxfer Glass—A special glass formed with prismatic projections on one side.

MACK PARTITION—A patent partition formed of plaster and reeds.
Mandrels—Cylinders of soft wood varying in length.
Margin Trowel—A parallel-sided trowel for plaster margins.
Massicot—A superior kind of oxide of lead.
Mastic—A resinous gum obtained from the Mediterranean.
Metallo-ceramic Joint—A patent joint for uniting lead pipe to earthenware.
Middling Lead Pipe—A pipe intermediate in weight between light and heavy.
Milled Lead—Sheet lead that has been rolled out.
Minium—Another name for red lead.
Mortise Lock—A lock that is inserted into a mortise formed in the thickness of a door.
Muffled Glass—Glass formed with a wavy surface.
Muffling—Covering a running mould with plaster to reduce its section.
Muffling Plate—A metal plate used to reduce the section of a running mould.
Muller—A kind of pestle used in grinding paint.
Muranese—A form of obscured glass.

NIB—The upper edge of a plasterer's running mould.
Nipple—The screwed end of gas pipe to receive the fitting.
Norfolk Thumb Latch—A latch operated by a lever which can be depressed by the thumb.

OIL POLISH—A finish produced with linseed oil.
Overflow—An outlet allowing water to escape on reaching its level.
Over Graining—A thin additional coat over ordinary graining.
Overcast Joint—One on which a series of facets are formed after wiping.
Oxide of Iron Paint—Paint in which oxide of iron forms the base.

PACKING PIECE—Iron slabs of various thickness used in levelling girders on stanchions.
Palette—A thin wooden board to receive paints used in decorative work.
Palette Knife—A long, flexible blade used in mixing up colours.
Painter's Torch—An apparatus for producing a flame for burning-off.
Pan Closet—An old form of w.c. in which a pan was employed to receive the contents.
Panel Float—A small float used for laying and smoothing work in panels.
Panel Trowel—Resembles a laying trowel, but is smaller.
Parian Cement—A white cement prepared from plaster of Paris and borax.
Parliament Hinge—A hinge having the form of an H.
Patent Size—A preparation of gelatine.
Pebble Dash—Another name for rough coat.
Pedestal Closet—A modern form of w.c. with basin and trap exposed to view.
Pivot—A projecting pin working in a socket.
Plaster of Paris—A fine white plaster prepared from gypsum.
Plate Glass—Glass poured hot on to a table and rolled out.
Pneumatic Bell—A bell operated by the compression of air.
Polished Plate—Plate glass that has been polished.
Polishing Trowel—A trowel used in finishing the setting coat of plaster.
Pot Metal—Glass which is coloured throughout its substance.
Pouring Stick—A short, grooved piece of wood to convey melted solder to the back of a joint.
Picking Up—Applying coarse stuff to walls, partitions, or cubings.
Priming—Covering a wood surface with the first coat of paint.
P-Trap—A trap the general form of which resembles a U.
Pulp Paper—The commonest class of wallpaper.

QUADRANT STAY—A stay bar for openings and arches having a quadrant form.
Quarries—Glass cut into small pieces for lead glazing.

RADIATOR—A closed metal vessel having a large superficial area for radiation.
Raglet—A chase cut in stonework to receive lead flashings.
Rain-water Gutter—A channel to receive rain-water from the caves of a building.
Rain-water Head—An open vessel above the pipe to receive the discharge from a gutter.
Rain-water Pipe—A metal pipe used to convey rain-water.
Red Lead—An oxide of lead, usually in the form of a red powder.
Reducing Pipe—One reduced from a larger to a smaller diameter.
Reflector—Reflecting surface used to alter the direction of rays of light.

Register Grate—One having a flap, or register, between the grate and the chimney.
Render—The process of laying coarse stuff or cement on solid walls or ceiling.
Return Pipe—That part of a circulating pipe between the highest level and the boiler.
Ribbon Joint—One in which a band of solder is formed round the joint.
R.I.J.—Abbreviation for rolled iron joist.
Rim Lock—A lock attached to the face of a door.
Rising Butts—Those that lift the door slightly as it opens.
Rising Main—The pipe taken up to supply a cistern.
Roll—The method of forming a longitudinal joint between two sheets of lead.
Rolled Plate—Plate glass that has been rolled to produce a fluted surface.
Rough Cast—A method of finishing exernal plaster with pebbles or shingle.
Rough Cast Plate—Cast plate rolled with a smooth roller.
R.S.J.—Abbreviation for rolled steel joist.
Rubber Cone—A union formed of rubber.
Rubbing Down—The process of rubbing each coat of painted work.
Rule—A strip of wood varying in size and form used in floating plaster.
Running Rule—Wood strips fixed as guides for running moulds.
Running Mould—Moulded profiles by means of which mouldings in plaster are formed.

SADDLE-BAR—A metal bar used to give support to lead lights.
Sanitary Paper—Wallpaper printed in oil colours and washable.
Sash Fastener—A metal catch to secure one sash to another.
Sash Lift—A metal hook or plate by which a sash is lifted.
Sash Tool—The brush used in painting sash-frames.
Sash Weight—Metal weights used to counterbalance the sash and its glass.
Satin Paper—Wallpaper having a polished, satin-like surface.
Scaglioler—A special form of coloured plaster used in imitation of marble.
Scouring—Working over plaster surfaces with a hand float.
Scratch—A tool used in scratching or scoring plaster surfaces to form a key.
Scratch Tools—Small tools of various shapes used in finishing plaster enrichments.
Screed—A strip of plaster laid as a guide for floating.
Seam Roller—A small roller used in smoothing the joints in paper-hanging.
Seamed Pipe—A lead pipe formed out of sheet lead with a soldered joint.
Setting—The process of laying and finishing the final plaster coat.
Setting Coat—The last coat in plastering, formed of fine stuff.
Service Pipe—A pipe conveying water from the supply to a fitting.
Sgraffito—Successive thin coats of coloured plaster incised and cut to give pictorial effects.
Shave Hook—A tool used in shaving lead-work.
Shaving—The process of removing a thin layer of lead to provide a bright surface.
Sheet Glass—Glass blown in the form of cylinders and afterwards flattened.
Shoe—The outlet of a rain-water pipe over a gulley.
Side-arm Roller—Resembles a seam roller, but will work close up to a projecting surface.
Silicate Cotton—A fibrous non-conducting material produced from iron slag.
Single-swing Bracket—A gas bracket having one movable arm.
Size—A liquid preparation of glue.
Size Kettle—A kettle with water jacket, in which size is melted.
Skimming Float—A large float used for laying setting stuff.
Slag Wool—See *silicate cotton.*
Slipper—The face of a running mould.
Slop Sink—A sink intended to receive bedroom slops.
Smoothing Roller—A broad roller used in paper-hanging.
Smudge—A preparation used by the plumber in soiling.
Snap Rivet—One formed with a spherical head.
Soakers—Sheets of lead inserted under slates or tiles, and turned up against a wall.
Soil—Another term for smudge.
Soiling—The process of covering with soil those parts of lead work to which solder is not required to adhere.
Soil Pipe—A pipe for conveying away the contents of w.c.'s.
Soldered Dot—A method of securing vertical lead sheets to woodwork or stone.
Soot Door—A small iron door and frame inserted in a smoke flue.
Sparge Pipe—A pipe arranged to distribute a discharge of water over a wide area.
Splash Stick—A small wood or iron stick used in upright soldered joints.
Sprig—A small metal brad used by glaziers.
Sprigging—Temporarily securing panes of glass with sprigs.
Stanchion—A perpendicular support under a girder.
Standing Waste—A waste pipe standing up within a cistern.
Stand Pipe—A vertical pipe fitted with a tap for drawing off water.
Stay Pipe—A metal bar used to secure a window when open.
Stencil—A pierced plate for painting designs that repeat.
Stepped Flashing—One cut to allow of the upper edge being turned into successive brick joints.
Step Setter—A tool used in forming stepped flashings.
Stiffeners—In built girders pieces of angle iron used to stiffen the web and flanges.
Stippling—Finishing a painted surface with the end of a paint-brush.
Stock—The backing for the profile plate in a running mould.
Stopcock—A valve used to shut off a supply.
Stopped End—A closed end to a rain-water pipe.
Stopping—The process of filling up small holes in woodwork or plaster.
S-trap—A trap the outlet of which is in the form of an S.
Strap—A narrow plate used in securing timber joints.
Strap Hinge—A hinge for heavy gates, fixed to them with iron straps.
Striking Plate—The metal plate into which the bolt of a lock is inserted.
Stucco—A somewhat vague term applied to several plastic mixtures.
Swan-neck—A bent pipe connecting a rain-water gutter and pipe.
Syphon Box—An apparatus used to collect water from gas supply.
Syphon Closet—One in which the contents are removed by syphonic action.

TACKY—The condition of paint or varnish which fails to dry properly.
Taft Joint—A wiped lead joint resembling in form a copper bit joint.
Tar Paint—A paint for iron formed with tar, lime and naphtha.
Tension Rod—An iron rod used in trussing timber beams.
Throat—In pipe-bending, the inner side of the lead.
Tie-rod—A metal rod replacing a tie-beam in a compound roof.
Tingle—A broad strip of stout lead used to hold down the edges of lead sheets.
Tinning—The process of covering a copper bit with solder.
T-iron—Iron rolled in the section of a T.
Toe—The lower end of the stock of a running mould.
Touch—A piece of tallow candle is used to touch lead surfaces after shaving.
T-piece—A form of union between two horizontal and one vertical tubes.
Traversing Rule—A rule used for forming screeds in gauged or setting stuff.
Trimming Knife—A knife used for trimming wallpapers.
Trowelled Face—A plaster face highly finished with a trowel.
Trumpet-mouth Waste—A waste pipe the mouth of which is enlarged like a trumpet.
Turnbuckle—A fastening of iron or brass turning on a pivot.
Turn Pin—Wood cones used for enlarging ends of lead pipes.
Tynecastle Canvas—A material moulded in relief on canvas for covering walls.

UNDERHAND JOINT—A wiped joint on a horizontal pipe.
Union—A screw joint to unite a pipe to a cistern or a lead and iron pipe.
Universal Joint—A ball-and-socket joint.
Upright Joint—A wiped joint on a vertical pipe.

VALLEY GUTTER—A gutter formed in the angle between two roofs.
Valve Closet—One in which the outlet of the basin is closed by a valve.
Vehicles—The liquid with which pigments are mixed to form paint.
Ventilating Stove—A stove provided with a hot-air chamber and air inlet.

WALL HOOK—An iron spike with a curved end that will grip a pipe.
Warning Pipe—One that gives notice by dripping when a cistern is full.
Washable Distemper—Material resembling distemper, but which may be washed.
Wash-down Closet—One in which the bottom of the pan is continued into the trap.
Wash-out Closet—One in which the contents of the pan are washed out into the trap.
Water Stain—A material used for altering the colour of woodwork.
Water Waste Preventer—A cistern using only a limited amount of water at each discharge.
Wax Moulds—Used by plasterers for casting enrichments.
Wax Polish—A glossy surface produced on wood with the aid of wax.
Web—The vertical member of an iron girder.
Weeping Pipe—A pipe which allows water to drip slowly.
Welted Joint—One in which two metal sheets are folded together to form a joint.
White Lead—A carbonate of lead, the base of many paints.
Whitewash—A mixture of whiting, water and double size.
Wired Glass—Glass in which wire netting is embedded.
Wiped Joint—A joint formed with solder by means of a cloth pad.

ZINC PAINT—A paint of which the base is zinc white.
Zinc White—An oxide of zinc.

NATURAL HISTORY

SEE ALSO BIOLOGY

ALBUMINOIDS—Complex substances chiefly of carbon, hydrogen, oxygen, sulphur, and, sometimes, phosphorus.
Ambulacrum—A groove in the star-fishes which lodges the tube-feet.
Ampulla—The swollen part of a semi-circular canal in the internal ear of vertebrates. Or a small sac connected with the tube-foot.
Atavism—The appearance of a trait unlike the immediate parents, but resembling a more remote ancestor.

BARB—One of the branches of a feather.
Biconcave—Hollow on both sides like the vertebra of a fish.
Bivalve—The shell of a mollusc when composed of two parts.
Blood-parasitism — A habit of some animals, such as the cuckoo, of placing their young with other parents.

CALYX—The outermost leaves of a flower.
Cephalopods — The cuttle-fishes, and their allies.
Cetacea—The order of mammals which includes the whales.
Cheiroptera—The order of mammals which includes the bats.
Chelonia—An order of reptiles which includes the tortoises.
Chordata—All animals which possess a notochord.
Chrysalis—The motionless pupa of butterflies and moths.
Chyle—The fluid which results from the action of digestion upon food.
Coccyx—The end of the spinal column.
Cœlom—The body cavity.
Colloid—Substances which do not readily pass through membrane pores.
Ctenoid—Term applied to certain fish scales with the hinder margins fringed.
Cycloid—A term applied to those scales of fishes which have a circular, or elliptical, outline with an even margin.

DECIDUOUS — Structures which are shed during the life of an organism.
Diphyodont — Applied to mammals which have two sets of teeth.

ELYTRA—A beetle's anterior wings.
Entomophilous—Flowers which are fertilised by insects.
Eozoic—The earliest geological period.

FLORA—The plants of any region.
Furculum—The "merrythought" bone of birds formed by the union of the two clavicles.

GANOID—Those scales in fish which have an inferior bony layer.
Gastrula—A term applied to that stage of the embryo which exhibits a double layer with mouth and digestive cavity.
Germinal disc—That part of the egg which develops into the embryo.
Gill-cover—The flap which overlaps the gill-slits in fishes.
Gonophore—A bud in which the egg cells, or sperms, are produced.

HETEROCERCAL — The unequally-lobed tail in fishes.
Hock—The ankle in a horse's hind limb.
Homocercal—Equally-lobed fish tails.

INFUSORIANS—A class of the protozoa.
Insectivora—An order of mammals.

KAINOZOIC—The most recent geological epoch.

LACERTILIA—The order of reptiles including the lizards.
Lepidoptera—Order of insects which includes butterflies and moths.

MAMMALIA—The class of vertebrates which suckle their young.
Mantle-cavity—The space in molluscs which contains the gill, and into which the excretory organs generally open.
Marsupials—An order of mammals.
Medusa—The egg-producing stage of a jelly-fish, usually free swimming.
Mesozoic—The geological epoch which preceded the kainozoic.
Mongrel—A cross between two varieties of the same species.
Monœcious — Those individuals in which the two sexes are united.
Monophyodont—Mammals which develop only one set of teeth.
Monotremes — The lowest order of mammals.
Morula—An embryonic stage in which the segmented ovum is not hollow, but solid.
Mule—A cross between a horse and an ass.
Muscle—A definitely shaped piece of flesh.
Mutualism — The association of two organisms for the benefit of both.

NAGANA—Fly sickness ; a fatal disease of horses caused by a parasite which is carried by the tsetse-fly.
Nearctic Region—The northern part of the New World.
Neuter—Having no fully developed sex.
Normal—Conforming to the ordinary standard.
Nucleated—Possessing a nucleus.
Nucleolus—A minute body inside a nucleus.
Nymph—The active pupa of certain insects ; the stage which hatches from the egg.

ODONTOPHORE—The masticating organ in molluscs and cuttle-fishes.
Operculum—The gill cover in many fishes, also the horny plate which closes the shell of some molluscs.
Opisthocœlous — Concave behind, as in some vertebræ.
Oriental region—Southern Asia, together with part of the East Indies, the Philippine Islands, and Formosa.
Otocyst—A vesicle filled with fluid containing some solid particles. A simple form of hearing apparatus, probably also a balancing organ.
Otolith—A hard substance inside the hearing organ.
Ovipositor—An organ at the hinder end of the body of a female insect by means of which holes are made in plants for reception of the eggs.
Ovule—The portion of a plant which becomes a seed after fertilisation.

PALÆONTOLOGY—The science which deals with fossils.
Perissodactyla — Hoofed quadrupeds which have an odd number (one or three) of toes.
Pineal body—A structure in the roof of the vertebrate brain which probably represents the remains of a dorsal eye in some reptiles.
Pinnate (or **Pennatiform**)—Feather-shaped.
Pisces—The class of fishes.
Pisiform—A small round wrist bone.
Placenta—The organ in the higher mammals which establishes the vascular connection between the mother and the fœtus ; the after-birth.
Placoid—Irregular, thick, bony scales, such as found in sharks and rays.
Pleura — Serous membrane covering lungs of air-breathing vertebrates.
Pollex—The innermost digit of the fore-limb—in man the thumb.
Procœlous—Concave in front, as in some vertebræ.
Proglottis—A segment, or joint, of a tape-worm.
Pronation—The act of turning the palm of the hand downwards.
Pyriform—Pear-shaped.

RAPTORES—The birds of prey.
Recapitulation—The repetition of the successive ancestral stages in the development of an organism.
Rennin—A ferment in the gastric juice which curdles milk.
Resemblance — General : a harmony with surroundings, causing the organism to be inconspicuous. It may be protective or aggressive, or both. Special : a likeness to some particular object in the environment.
Reticulum — A network ; the second division of the complex stomach of a ruminant.
Retractile—An organ which is capable of being drawn back.
Rodentia — An order of mammals, gnawers.
Rostrum—The suctorial organ formed by the appendages of the mouth in certain insects ; any kind of beak.
Rotifera—The wheel animalcules.
Rudimentary organ — A structure which is not fully developed.
Rumen—The first division, or paunch, of the complex stomach of a ruminant.
Rumination—Process of cud chewing.

SACRUM—The part of the backbone with which the pelvic arches unite.
Scolex—Embryonic stage of tape-worm.
Sessile—Not supported by any stalk.
Setæ—Bristles.
Spermaceti—Liquid fat obtained from the sperm whale, contained in a deep depression in the side of the skull.
Spinnerets—Small projections on the under side of the abdomen of spiders, on which silk glands open.
Spiracle—The apertures of the breathing tubes in insects ; also the single nostril, or blow-hole, of cetaceans.
Supination—The act of turning the palm of the hand upwards.
Suture—The line of union between two immovable parts, as in skull bones.
Swim-bladder—An outgrowth from the alimentary tube of some fishes.
Swimmerets—The limbs of crustaceans which are adapted for swimming.
Symmetry—Regularity of structure, which may be either radial or bilateral (having right and left sides).
Symphysis—The union of two bones in which there is very limited motion.

TÆNIA—An order of tapeworm.
Teleostei—The order of the bony fishes.
Tetradactyl—Having four digits.
Tortoise-shell—A product of the horny plates obtained from certain turtles.
Trichocyst—Minute rods found in some Infusorians which are projected from the outer layer of the body for defence.
Tunicata—The sea squirts.

UNIVALVE—The shell of a mollusc composed of only one piece, as in the snail.
Urostyle—The hindmost portion of the backbone of a frog.

WAMPUM—The shell money of the North American Indians.
Water-vascular system — An arrangement of tubes, as in star-fish, concerned with locomotion and respiration.

ZOOTOMY—The science of the anatomy of the lower animals.
Zymotic—A term applied to diseases which are contagious.

BACTERIOLOGY

ACID-FAST—A term applied to those organisms which retain stains even though treated by decolourising acid solutions.

Actinomycosis — A disease most common in cattle, especially in the jaws, caused by the actinomyces or ray fungus.

Ærobic—A term applied to micro-organisms which require oxygen to enable them to grow.

Agar-agar—A substance prepared from the roots of seaweeds, used to solidify the medium in which organisms are grown.

Agglutination—The phenomenon observed when organisms are placed in a serum prepared from an animal immunised against similar organisms. The organisms thus treated are observed to lose their motility, and become aggregated or "agglutinated" into clumps.

Agglutinins—Definite substances in a serum, which causes the phenomenon of agglutination.

Alexins—Substances present in normal blood serum, which help to confer natural resistance to infection.

Anærobic—A term applied to organisms which will not grow in the presence of air.

Anthrax—An infective disease caused by the anthrax bacillus; communicable to man, in whom it causes woolsorters' disease of the lungs; malignant pustule in the skin.

Anti-bacterial Serum—A preparation of blood serum from an animal, which is destructive to certain microbes.

Antitoxic—Having the power of antagonising toxin.

Antitoxic Serum—A preparation of the blood serum from an animal, which antagonises the poison or "toxin" of certain microbes (*e.g.*, anti-diphtheritic serum).

Antitoxin — A substance which antagonises a toxin.

Attenuation—The process by which the virulence of a microbe can be reduced.

BACILLUS—Literally a small rod; a term applied to many organisms, which are of that shape.

Bacteria—Literally rods; but used to refer to micro-organisms in general.

Bactericidal—Having the power of destroying bacteria.

Beggiatoa—A group of organisms composed of indistinctly articulated threads, containing sulphur granules.

Blood Serum—A nutrient medium in which organisms are grown.

CHEMIOTAXIS—The name applied to the attraction or repulsion exercised upon bacteria by chemical agents (positive and negative chemiotaxis respectively).

Chromogenic—A term applied to organisms which produce pigment.

Cilia—Minute protoplasmic threads attached to the sides or ends of organisms, by means of which they move.

Cladothrix—A group of organisms in which there is an appearance of branching, really due to two terminal cells lying side by side.

Clubs—Elongated, pear-shaped bodies seen at the periphery of a colony of the actinomycosis parasite.

Coccus—A round organism occurring either singly, in pairs, in fours, in chains, or in bunches.

Colony—The term applied to a number of organisms growing together.

Complement—A substance developed during the process of immunisation.

Culture—The name applied to the growth of one single species of microbe when artificially cultivated.

Cytolytic Sera—Sera which are destructive to cells.

DIPLOCOCCUS—A coccus occurring in pairs.

Disinfectant—Any substance which has the power of destroying the life of microbes.

Drying—One method employed to weaken the virulence of organisms.

EHRLICH'S SIDE-CHAIN THEORY—The term applied to the theory advanced by Ehrlich to account for the formation of antitoxins in the body.

Enhæmospores—Spores found in the blood (as in malaria).

Exhaltation—The increase of virulence of microbes; the converse of "attenuation."

Exotospores—Spores occurring in the body of the mosquito; a stage in the life cycle of the malaria parasite.

FACULTATIVE—A term applied to organisms which can live either with or without oxygen.

Farcy—A form of glanders, affecting the lymphatic vessels and glands.

Fever—An abnormal rise of body temperature, frequently caused by microbes or their toxins.

Fission—A process of multiplication in microbes.

Flagella — Delicate protoplasmic threads [see *cilia*].

GELATIN—A substance used to solidify nutrient media.

Gentian-Violet—A stain much used to demonstrate microbes.

Gram's Method—A process of staining which differentiates certain organisms from others.

HÆMAMŒBA MALARIÆ — The parasite of quartan fever in man.

Hæmamœba Vivax—The parasite of tertian fever in man.

Hæmolytic Serum—The blood serum of one animal which has the power to a certain extent of dissolving the red blood corpuscles of another animal of different species.

Hæmomenas Præcox—The parasite of malignant or aestivo-autumnal fever of man.

Hydrophobia—An infectious disease occurring chiefly among carnivora, especially in the dog and wolf; transmitted by bite.

IMMUNE BODIES—Substances developed during the process of immunisation.

Immunisation—The process of rendering an animal immune.

Immunity—That condition of an individual, an organ, or a tissue, in virtue of which it is enabled to resist infection either absolutely or partially. Immunity may be natural or inborn, or it may be artificial or acquired. According to the means used for the production of immunity, it is active or passive. Active immunity is obtained by injections of organisms either attenuated or in sub-lethal doses; or, secondly, by injection of their products or toxins. Passive immunity is the injection of the serum of one animal, highly immunised by active immunity, into another animal, the latter being thus rendered immune.

Incubator—An apparatus used to cultivate organisms which require constant warmth.

Inoculation—The injection into an animal of microbes or toxin by means of a hypodermic syringe. Also, a means of separating one organism from a mixture of organisms.

LEUCOCYTES—White blood corpuscles, which act as phagocytes—*i.e.*, they have the power of taking up microbes into their protoplasm.

Leucocytosis—An increase in the number of leucocytes.

Lysogenic Action—The destructive action of an anti-serum upon organisms. It is due to two substances—the immune body and the complement, or alexin [see above].

MACROPHAGES—Any cells larger than the small leucocytes which have the power of ingesting bacteria.

Mallein—A substance used to diagnose glanders, prepared from cultures of the glanders bacillus.

Micrococcus—A general term applied to any small round microbe.

Microphages—The smaller leucocytes which ingest bacteria.

Myelocytes—Cells in bone marrow from which leucocytes develop.

NITRIFYING BACTERIA—Bacteria in the soil which make nitrogen more available for plant nutrition by conversion of ammonia into nitrites and nitrates. Others take up free nitrogen from air, and combine it into compounds.

OPSONIC INDEX—A means of stating the power of opsonins. The opsonic index is the ratio of the bacilli ingested by leucocytes incubated in the patient's serum to those ingested by an equal number of leucocytes incubated under similar conditions in healthy serum. Thus for tubercle bacilli the opsonic indices of healthy persons may vary from 0·8 to 1·2; in tubercular patients it may be as low as 0·3 or as high as 1·8.

Opsonins—Substances contained in blood serum which act upon bacteria rendering them more easily eaten by leucocytes. (From Greek words meaning "prepared for being eaten.")

PASSAGE—The process of passing a microbe through the body of an animal for purposes of attenuation or isolation.

Pathogenic—Productive of disease.

Pfeiffer's Phenomenon—A destruction of organisms by lysogenic action [see above] due to a specific substance in the serum.

Protective Inoculation—The conferring of immunity by active methods.

Ptomaines—Substances containing nitrogen isolated from putrefying matter or from cultures of microbes.

RECEPTORS—The name given by Ehrlich to groups of atoms with affinity for certain foodstuffs.

Ricin—A vegetable poison (allied to bacterial toxin).

SARCINÆ — Coccus-like organisms which divide in three axes at right angles to one another, usually seen in cubes of eight.

Septicæmia—A condition in which microbes multiply within the blood stream, and give rise to symptoms of general poisoning without the production of abscesses.

Spirilla—Organisms which are in the shape of cylindrical, wavy, or spiral cells.

Staphylococcus — A coccus which occurs in clusters.

Sterilisation—The process of rendering any substance free from microbes.

Streptothrix—An organism consisting of a mass of filaments in which true branching occurs.

TETRAD—The occurrence of an organism in fours (Tetracoccus.)

Toxin—A bacterial product of poisonous action.

Tuberculin—A curative or diagnostic agent for tubercular affections, prepared from cultures of the tubercle bacillus.

UNIT OF IMMUNITY—The amount of antitoxic serum which will neutralise 100 times the minimum lethal dose of toxin, serum and toxin being mixed, diluted, and injected subcutaneously. A normal antitoxic serum is one of which 1 c.c. contains an immunity unit.

ELECTRICITY

ACCUMULATOR—A cell in which the energy stored as chemical energy can be re-converted at will into electrical energy.

Air-gap—The air-space between two poles of a magnet.

Alternating Current—An electrical current which reverses in direction of flow in a periodic manner.

Alternator—An electrical generator producing in its external circuit alternating currents.

Ammeter—An instrument which measures and indicates in amperes the rate of flow of an electric current.

Ampere—The unit of rate of flow of an electric current in the C.G.S. system of units.

Ampere-hour—The amount of electricity which passes along an electric circuit when one ampere flows for one hour.

Ampere-turn—The magnetic effect produced when a current of one ampere flows round one complete turn of wire.

Anode—In an electric cell, the metal through which the current enters.

Arc—A luminous electric discharge through a gas, in which the material of one or both of the electrodes is volatilised and takes part in conducting the electric current.

Armature—Generally the rotating part of a dynamo or motor, upon which the moving conductors are mounted.

Armature Core—The laminated steel stampings forming the body of the armature, in the slots of which the conductors are placed.

Asynchronous—The name given to an alternating current motor whose speed has no fixed relation to the periodicity of the supply.

Auto-transformer—A transformer so wound that part of the primary winding acts also as a secondary.

B—The number of magnetic lines per square centimetre of material, or, more briefly, the flux density.

Balancer—A motor generator or accumulator used to equalise the pressure on either side of a three-wire system.

Battery—A number of cells or condensers working together.

Board of Trade Unit—The standard unit of electric energy—1000 watts acting for one hour, or its equivalent.

Booster—A motor generator used to add a given pressure to an electrical circuit.

British Thermal Unit—The quantity of heat required to heat 1 lb. of water 1° Fahr.

CANDLE-POWER—A measure of the intensity of light in a given direction.

Cascade Connection—Connecting two induction motors so that the secondary of one is in series with the primary circuit of the other.

Cell—Usually a vessel containing suitable electrodes and an electrolyte for generating an electric current.

C.G.S. System of Units—The system of electrical units in general use, based on the centimetre, gramme, and second.

Characteristic Curve—A curve showing the relation between the speed and voltage of a dynamo or motor.

Choking Coil—A coil of wire so wound that its self-induction largely exceeds its electrical resistance.

Circuit Breaker—An apparatus, usually automatic, for breaking an electrical circuit.

Commutator—That part of an armature which ensures that, in the external circuit of a dynamo or motor, the current shall be continuous in direction of flow.

Compound Wound Dynamo—A dynamo having both series and shunt wound coils in the field magnet circuit.

Compound Wound Motor—A motor having both series and shunt wound coils in the field magnet circuit.

Condenser—An apparatus consisting of two layers of an electrical conductor separated by an electrical insulator.

Conductor—A substance allowing electricity to pass along with comparatively small loss.

Continuous Current—A current of electricity flowing along a conductor in one direction only.

Controller—An apparatus consisting of a number of switches and electrical resistances, used for regulating the speed of a motor.

Coulomb—The unit of electrical quantity in the C.G.S. system of units.

Current Density—The number of amperes flowing at a given time per unit area of conductor.

DEPOLARISER—A substance placed in a primary cell to prevent the collection of hydrogen gas on a kathode.

Diamagnetic—Having magnetic permeability value lower than that of air, which is taken as unity.

Dielectric—A substance having a very high electrical resistance.

Dielectric Capacity—The relative high resistance of so-called insulating bodies as compared with air.

Distributing Board—A board on which a number of electrical switches or fuses, or both, are placed.

Diversity Factor—The number obtained by dividing the sum of the maximum loads of the individual consumers of an electricity supply system, during a given time, by the maximum load on the station during the same period.

Dry Cell—A primary cell in which the electrolyte is in the form of a colloid or jelly, and that consequently is unspillable.

Dynamo—A machine for converting a mechanical motion into electrical energy (continuous current), by means of a conductor moving in a magnetic field.

Dynamometer—An electric dynamometer is an instrument for measuring electrical forces by the action on each other of two coils carrying the current to be measured.

EARTH-PLATE—The ground connectors of a lightning-rod, usually a copper plate immersed in damp earth.

Efficiency—The ratio of work done to the work expended in doing it.

Electric Bell—A bell actuated by an electric current, usually from a distant point.

Electric Circuit—A continuous line of electric conductors, along which a current of electricity can flow.

Electric Current—The name given to the electrical activity of an electric circuit when a difference of electrical pressure exists between varying points in the circuit.

Electrode—An electrical conductor terminating in an electrolyte.

Electrolysis—Chemical decomposition caused by the passage of an electric current through an electrolyte.

Electrolyte—A liquid which, when acted upon by an electric current, undergoes decomposition.

Electromagnet—A magnet, consisting usually of a soft iron core, which is magnetic only so long as an electric current flows round the exciting surrounding coil.

Electromotive Force—The force which tends to send an electric current flowing through an electric circuit.

Electron—The atomic quantity of electricity which, associated with an atom of matter, is called an ion.

Electrostatic Field—The name given to the space surrounding a charged electrical conductor, in which electrical action is induced by the charge on the conductor.

Enclosed Fuse—A thin piece of fusible wire placed in a glass, china, or cartridge case.

Ether—See *Luminiferous Ether*,

FARAD—The unit of electrical capacity in the C.G.S. system of units.

Feeder—A cable or pair of cables in an electrical distributing system which run, untapped, from the generating station to the feeding point.

Ferraris Field—The rotating magnetic field of an induction motor.

Field Magnet—The name given to the magnet poles of a dynamo or motor.

Flame Arc Lamp—An arc lamp in which the greater part of the light comes from the flame and not from the electrodes.

Foot-candle—The illumination obtained at a foot distance with a source of light of one candle-power.

Fuse—A thin fusible wire, inserted in an electric circuit to melt, and so break the circuit, before any other part of the circuit is damaged.

GALVANOMETER—An instrument for measuring small electric currents.

Gauss—The unit of magnetic force in the C.G.S. system of units.

Glow Lamp—An electric lamp in which the light is produced by the incandescence of an electrical conductor.

H—The number of magnetic lines per square centimetre there would be in air; or, more briefly, the intensity of the magnetising force.

Henry—The practical unit of the coefficient of self-duction or mutual induction in the C.G.S. system of units.

Horse-power—The industrial unit of power. In this country it is equivalent to 33,000 foot-pounds per minute, or, in electrical units, 746 watts.

Hysteresis Loss—The power dissipated in iron by reason of magnetic hysteresis.

IMPEDANCE—The apparent resistance, composed of actual resistance and self-induction, which determines the flow of current in an alternating current circuit.

Induced Current—A current produced in a closed electric circuit by the action of a current of varying strength in an adjacent electrical circuit.

Induction—The action, either magnetic or electric, produced in bodies by adjacent, but not touching, magnets, electric circuits, or charged electrical bodies.

Induction Motor—An alternating current motor in which the current in the rotating part is produced by electromagnetic induction.

Inductive Load—An apparent load in an electric circuit greater than the real load by reason of the self-induction of the circuit.

Insulation Resistance—The electrical resistance of the insulation between two conductors, or between one insulated conductor and earth.

Insulator—A substance offering a high resistance to the passage of an electric current.

Interpoles—Small extra magnetic poles in a dynamo or motor, introduced to reduce the sparking at the commutator with varying load.

Inverted Arcs—Arc lamps arranged so that all the light is reflected towards the ceiling and no direct rays reach the observer.

Ion—An atom of matter combined with an electron.

JOULE—The unit of work done in an electrical circuit in one second in the C.G.S. system of units.

Joule's Law—The law relating the heat produced in an electrical circuit to the current flowing in the circuit.

KATHODE—In an electric cell, the metal through which the current leaves the cell.

Kilowatt—The name given to 1000 watts, a convenient unit of electrical power.

LAGGING CURRENTS—An alternating current flowing in a circuit later than its corresponding electrical pressure.

Leading Current—An alternating electric current flowing in a circuit in advance of its corresponding electrical pressure.

Leakage Coefficient—That proportion of the magnetic flux of dynamos and motors which does not pass through the armature, but leaks across by some other path.

Lightning Arrester—An appliance for protecting an electric circuit from the effects of lightning.

Lightning-rod—A copper rod placed on buildings to protect them from lightning.

Load Factor—The ratio between the energy used in an electrical circuit in a given time to the maximum load operating for the same period.

Luminiferous Ether—The name given to the substance pervading space and the interstices of all bodies, vibrations in which convey light, heat, and electricity.

μ—The symbol used for the magnetic permeability of a substance.

Magnet—A substance possessing the property of attracting magnetic substances and producing magnetic fields.

Magnetic Blow-out—An appliance using an electromagnetic field for the purpose of extinguishing an electric arc.

Magnetic Field—The space surrounding a magnet through which magnetic action is transmitted.

Magnetic Flux—The number of magnetic lines of force passing through a given area.

Magnetic Flux Density—The number of magnetic lines of force per square centimetre.

Magnetic Hysteresis—The tendency by which magnetic changes lag behind the magnetic forces causing them, the overcoming of which causes loss.

Magnetic Induction—The production of a magnet by the proximity to it of another magnet.

Magnetic Lines of Force—The imaginary lines along which magnetic action is transmitted.

Magnetic Permeability—The numerical coefficient expressing the ratio between flux density (**B**) and magnetising force (**H**).

Magnet Pole—Those parts of a magnet in which the power to produce magnetic effects are concentrated.

Maximum Demand System—A system of charging for electric energy dependent to a large extent on the maximum amount of power taken.

Maxwell—The unit of magnetic induction in the C.G.S. system of units.

Mesh Winding—A method of connecting the phases of a polyphase circuit so that, together, they form a closed circuit without any common neutral point.

Microfarad—The name given to one-millionth part of a farad.

Microphone—An apparatus for electrically magnifying minute sounds.

Milking Booster—A low pressure dynamo, usually motor-driven, used to charge single cells in an accumulator battery.

Motor Generator—Two electrical machines, either alternating or direct current, or one of each, rigidly coupled together, one acting as motor and the other as generator.

Motor Starter—A special switch and resistance used to protect the motor on starting.

NON-INDUCTIVE LOAD—A load on an electric circuit in which there is no apparent increase due to self-induction.

OHM—The unit of electrical resistance of units in the C.G.S. system of units.

Ohmmeter—An instrument which measures and indicates the resistance in ohms of an electric circuit.

Ohm's Law—The law expressing the relation of the rate of flow of current in an electrical circuit to the electrical pressure and the resistance.

PERIODICITY—The number of complete cycles of change which an alternating current makes in one second.

Permanent Magnet — A substance (usually steel) which, having been magnetised, retains its magnetic properties.

Polarisation—The reduction of effective electrical pressure in a primary cell, caused by the generation of gases at the electrodes.

Potentiometer — An instrument for measuring electrical resistances by balancing a current against a known fall of electrical pressure.

Power Factor—The ratio in an alternating current circuit between the real load and the apparent load.

Primary Cell—A cell containing an electrolyte and suitable electrodes for obtaining an electric current through a closed external electric circuit.

RATIO OF TRANSFORMATION—The ratio of the number of turns on the primary and secondary windings of a transformer.

Rectifier—An apparatus for converting alternating into direct currents.

Relay—An apparatus for opening or closing a circuit controlled by the current in another circuit.

Remote Control—Appliances for opening or closing electrical circuits at distant points.

Residual Magnetism—The small magnetic strength left in an electromagnet after the current has been switched off.

Resistance—The property of a body retarding the flow of an electric current through it.

Retentivity—The magnetic force needed to overcome the residual magnetism of a substance.

Rheostat—An easily adjusted electrical resistance.

Rotary Convertor—A dynamo having a commutator at one side of the armature and slip rings connected at special points to the armature winding, at the other. Used for converting alternating into direct currents.

Rotor—The rotating part of an induction motor having an independent electrical circuit.

SELF-INDUCTION — The inductive effect exercised upon an alternating electric circuit by itself.

Series Dynamo—A dynamo having both field and armature circuits wound in series with each other.

Series Motor—A motor having both field and armature circuits wound in series with each other.

Shunt—The name given to an electrical circuit which is connected in parallel to another electrical circuit.

Shunt Dynamo—A dynamo having the field circuits wound in shunt with the armature circuit.

Shunt Motor—A motor having the field circuits wound in shunt with the armature circuit.

Silver Voltameter—An electrolytic cell in which a silver salt is the electrolyte.

Single Phase—The name given to a single alternating current circuit.

Slip—The difference between the actual and theoretically definite speed of a synchronous motor.

Slip Ring Rotor—A rotor having slip rings through which the induced current may, at starting, be taken to an external resistance.

Solenoid—A coil of wire forming part of an electric circuit, used for producing a magnetic field.

Squirrel-cage Rotor—A rotor having the electrical winding simply short-circuited on itself.

Stalloy—A steel alloy containing a small quantity of silicon, and much used for dynamo, motor, and transformer stampings.

Star Winding—A method of connecting the phases of a polyphase circuit so that these meet at a neutral point.

Stator—The fixed part of an induction motor, through the winding of which the primary current flows.

Synchronous Motor—An alternating current motor whose speed bears an approximate relationship to the periodicity of the circuit on which it is used.

THERMOPILE—A number of couples of suitable metals, connected to give the maximum thermo-electric effect.

Three Phase—An alternating current circuit, usually of three wires, in which three alternating currents flow, having a phase displacement of 120°.

Tractive Effort—The torque or turning moment of an electric motor.

Transformer—An apparatus consisting of two electrical windings, usually independent of each other, together with an iron core, used for changing the voltage of an alternating current.

Tungsten Lamp—An electric glow-lamp having a very thin wire or thread of tungsten for the filament.

Two Phase—An alternating current circuit, usually of four wires, in which two alternating currents are flowing, having a phase displacement of 90°.

VOLT—The unit of electrical pressure in the C.G.S. system of units.

Voltmeter—An instrument which measures and indicates in volts the electrical pressure between any two points of an electrical circuit.

WATT—The unit of electrical power in the C.G.S. system of units.

Watt Hour—The electrical power expended when one watt operates for one hour, or its equivalent.

Watt Hour Meter—An instrument fitted with an integrating mechanism, for measuring watt hours or the energy sold to an electricity consumer.

Wattless Current—That part of an electric current flowing through an inductive alternating circuit which is not doing any useful electric work.

Watt Meter—An instrument which measures and indicates in watts the electrical power being expended in an electrical circuit at any moment.

Weston Standard Cell—A primary cell, using cadmium as one electrode, used as a standard for obtaining electrical pressure.

Wheatstone Bridge—An instrument for measuring electrical resistances by balancing them against other known electrical resistances.

THE TEXTILE TRADES

ABASSI—A whitish Egyptian cotton.
Absorbent Cotton—Bleached fibre made from linters (*q.v.*)
Alpaca—Hair of Peruvian lama.
Amazon—An all-wool dress stuff.
Angola—Yarn of mixed woollen and cotton.
Angora—Goat, producer of mohair.
Astrachan—Curled pile fabric.
Axminster—Tufted carpet.

B. A. WOOL—From Buenos Aires.
Baft—An export calico, white or blue.
Bannockburns—Tweeds from twist yarn.
Bast—Fibres from under the bark of plants.
Beam—Large roller to carry warp yarn.
Beatrice—Weft twill, 4 up and 1 down.
Beaver—Heavy woollen cloth, fine face, smooth back.
Beer—Warp threads grouped for convenience.
Beetles—Machines to hammer fabric.
Bleaching—Whitening cotton or linen by chemical or other means.
Bleeding—The "running" of colours.
Blends—Mixtures of loose fibres.
Block-printed—From flat blocks, not cylinders.
Blowing-room—Room in which raw cotton is opened and freed from dust.
Bobbins—Yarn carriers, usually double-ended.
Botany—Australian merino wool.
Bowl—Heavy rollers in cloth finishing.
Box-looms—Working more than one shuttle.
Breech—Wool of the coarest growth.
Brocades—Jacquard-figured satins.
Brussels—Loop-pile carpet.
Bump—Extremely coarse cotton yarn.
Bundles—Parcels of yarn, usually 10 lb.
Bunting—Flag cloth, worsted or cotton.
Burling—Removing minor defects in cloth.
Burr—Spines of weed often present in wool.

CABOTS—Grey cotton sheetings.
Calendering—Cloth-pressing between rollers.
Calico—Plain-woven cottons.
Cambric—Plain, fine cottons or linens.
Camelhair—Produce of bactrian camel.
Cap-spun—Worsted spun on cap spindles.
Cape Wool—South African.
Carbonising—Eliminating vegetable matter by use of acids.
Card-clothing—Fabric furnished with wire teeth for covering the cylinder of carding machines.
Carding—Preparing fibre for spinning by means of fine wire teeth.
Cashmere—(1) Hair of Kashmir goat; (2) twilled dress goods of merino wool or merino and cotton; (3) used to signify high-class worsted.
Chain—Synonym for warp.
Chardonnet Silk—Artificial silk, nitrated cellulose.
Cheeses—Yarn cross-wound on tubes.
Chenille—Fabric woven from fringe.
Cheviot—Synonym for crossbred. Strictly, wool from Cheviot sheep.
Chevron—Herringbone pattern.
China Grass—Hand-stripped ramie fibre.
Chlorination—Process to render hosiery unshrinkable.
Cleaning Waste—Prepared cotton thread waste.
Clothing Wool—Too short for the woolcomb.
Coatings—Men's worsteds.
Codilla—Scutchers' tow.
Coir—Coconut fibre.
Comb—Machine for removing shorter fibres.
Condenser—Forms sliver from web delivered from carding engine.
Condition—Proportion of moisture present.
Cop—Paper tube for carrying yarn.
Corkscrews—Fine warp twills.
Counts—Yarn numbers indicating fineness.
Crabbing—Treating to prevent shrinkage in course of dyeing.
Crape—Crimped fabric.
Creel—Frame for holding yarn bobbins.
Crinoline—Stiffening-cloth, horsehair, and cotton.
Crossbred—Wool from sheep of crossed merino strain.
Cross-dyes—Effects obtained on mixed fabrics, the wool dyed one colour and the pattern another.
Crowns—Grades of flax.
Cuttling—Folding cloth in plaits.

DECATISING—Treating woollens with dry steam.
De-gumming—Removing gum from silk or ramie.
Delaine—Light worsted for printing.
Denier—Denotes fineness of silk.
Derby Doubler—Forms laps from cotton sliver.
Designing—Planning out fabrics.
Devil—Disintegrating machine for rags.
Dhooties—Cotton loin-cloths, bordered.
Diagonals—Cloths with pronounced diagonal rib.
Discharge-effects—Produced by removing colour previously applied.
Dobby—Modification of the jacquard.
Doctors—Scrapers fixed on printing machines.
Doeskin—Superfine woollen, soft finished.
Doffers—Remove bobbins from spindles, or fibres from rollers.
Donskoi—South Russian wool.
Double-spun—Cotton yarn cleared of defects.
Double-warp—The warp of two-fold yarn.
Doubling—Converting single into two-fold yarn.
Down Wool—From sheep of Downs breed.
Draft—Ratio in which sliver is decreased in course of drawing.
Drawing—The reduction of sliver.
Drill—Cottons or linens warp-twilled.
Dry-spun—Wool spun without oil. Linen spun without water.
Duck—Canvas.
Duvetyn—Smooth finish produced by emery rollers.

EGYPTIAN—Brownish cotton from Egypt.
Elastic Web—Tape with rubber threads in warp.
End—(1) A thread of warp; (2) a short length of cord.
Extract—Wool fibre recovered by carbonisation.

FANCIES—Goods of diversified character; distinct from plains.
Fearnought—Strong-toothed opening machine.
Fellmongers—Dealers in skin wool.
Felt—Fabric formed by interlocking loose fibres.
Fents—Remnants of cloth.
Filature—Silk-reeling factory.
Fingering—Yarn for hand-knitting.
Flannel—All-wool fabric.
Flannelette—Soft cotton fabric.
Flax—Raw material of linen.
Floats—Unintersected threads on the surface of fabrics.
Flocks—By-products in raising, shearing, or milling cloths.
Floorcloth—Oilcloth.
Fly Waste—Fluff.
Flyer-spun—Yarn from fly spindles.
Frames—Machines.
Frieze—Rough woollen cloth.
Frog—Part of cotton loom.
Fustian—Heavy cotton cloth.

GALATEAS—Striped and coloured cloth.
Galoons—Hat ribbons.
Garnetts—Machines with saw teeth for opening twisted fibres.
Gassed Yarn—Singed free of protruding fibres.
Gauze—Light fabrics with adjoining warp threads crossed.
Gauze-points—Constants used in calculating drafts in spinning.
Gilling—A straightening process practised upon long fibre.
Gin—Machine for removing cotton from its seed.
Gingham—Checked cottons for aprons, etc.
Grandrelle—Hard-twisted yarn, strands of separate colours.
Grant-reeled—Hanks of cross-wound yarn.
Grasscloth—Chinese native manufacture from ramie.
Greys—Goods unbleached or undyed.
Gunclub—A double-check design.
Gun-cotton—Nitrated cotton or cotton-waste.
Gunnies—Jute bagging cloth.

HACKLE—A flax-comb.
Half-bred—English wool from crossed breeds of sheep.
Hank—Standard measure of yarn.
Hard Waste—Thread waste.
Harris Tweed—Made in Harris, Hebrides.
Harvards—Coloured shirtings, 2-and-2 twill.
Heald—(Heddle.) Apparatus for lifting warp threads in weaving.
Hedge—Protective sale or purchase.
Hessian—Packing canvas.
Hoggets—First-shear sheep and wool.
Hopsack—Basket weave; weaving two threads plain instead of one.
Horsehair—Tail and mane hair.
Humidifiers—Atmospheric moisteners.
Hydro-extractor—Centrifugal dryer.

ICELAND WOOL—Fine, silky wool of Icelandic origin.
Indian Cotton—British East Indian growth.
Indigo-dyed—Containing some indigo, natural or synthetic.
Italians—Sateen linings, cotton or worsted and cotton.

JACK FRAMES—For drawing cotton rovings exceptionally fine.
Jacks—Knitting-machine bars.
Jaconet—A form of cambric.
Jacquard—Appliance for weaving figures.
Jeans—Cotton twills for linings.
Jigger—A dyeing machine.
Joanovitch—A silky Egyptian cotton.
Jobs—Imperfect goods.

KEMPS—Opaque wool fibre.
Khaki—A brown-green shade.
Kibizzos—Japanese waste silk.
Kidder Carpets—Cloth carpets.
Kier—Bleaching vat.
Knicker Effects—Coloured flakes or lumps present in yarn.
Knotless Yarn—Spliced at its joinings.
Knubs—Silk reelers' waste.

Lappets—Cloth with extra warp figures woven on the surface.
Laps—Sliver rolled in layers.
Lastings—Made for boot-tops, corsets, etc.
Leas—Parts of a hank.
Lenos—Gauzes with open patterning.
Levers' Lace—Made on Levers' machines.
Line—Linen.
Lingos—Weights for jacquard cords.
Linters—Fibre remaining on the cotton seed after ginning.
Lisle—Hard-twisted cotton yarn.
List—A selvedge.

London-shrunk—Fully shrunk woollens.
Longcloth—Calico for under-garments
Loom—Weaving machine.
Lump—A double-length piece.
Lustre Wool—Lincoln and Leicester wools.

M. V. WOOL—Shipped from Monte Video.
Manufacturer—Producer of cloth.
Maranham—A Brazilian cotton.
Marine Fibre—Poseidonia Australis.
Market Whites—Fully bleached cotton pieces.
Mauds—Rugs.
Mays—An irregular twill weave.
Melange—Sliver-printed.
Meltons—Woollens with raised and cut surface.
Mending—Inserting dropped threads in cloth.
Mercerised—Treated with caustic alkali.
Merino—(1) Wool of the merino sheep; (2) Blended wool and cotton hosiery; (3) Dress goods of merino wool.
Metallics—Prints ornamented with metal dust.
Metric Count—496 yards per lb.
Middling—Standard American cotton.
Milling—A process for consolidating wool cloths.
Mitafifi—Normal Egyptian cotton.
Mixture—Mixed colourings, without regular patterns.
Mohair—Fleece of Angora goat.
Moires—Watered patterns.
Mordant—Agent in fixing colours upon fibre.
Mule—Intermittent spinning machine.
Mulls—Fine muslin.
Mungo—Short fibre from milled woollen rags.

NAINSOOK—Light, soft cotton fabric.
Naps—Heavy woollens with a raised and rubbed surface.
Neat Silk—Thrown silk.
Nep—Little balls of fibre formed by twisting around the teeth of combs or cards.
Net—A loop fabric.
Noble Comb—Circular wool-combing machine.
Noils—By-product of combing.
Northrop—Loom with automatic replenishing of weft.

OOZE—Slubs in cotton yarn.
Open-Band—Yarn-twist running clockwise.
Opening—Loosening out fibres.
Operative—A millhand.
Organzine—Thrown silk for use as warp.
Orleans—Cotton shipped from New Orleans.
Overcheck—A large check superimposed on smaller ones.

PACK—240 lb. of wool, tops or yarn.
Padding—Dyeing cotton with rollers and a shallow trough.
Paper Yarn—Twisted paper.
Paramattas—Union wool goods for waterproofing.
Pattern—Sample of cloth. Synonym also for design.
Pectose—Vegetable wax.
Perching—Cloth-examining over rollers.
Peruvian—Rough cotton used to mix with wool.
Pick—A weft thread.
Picking Strap—Communicates motion to shuttle.
Piece—Standard length of fabric, varying in different goods.
Piece-dyed—Dyed after weaving.
Pile—Erect surface of loops cut or uncut, or of raised fibres.
Piques—Cottons ribbed warpwise.
Pirns—Bobbins unprotected at ends.
Pitch—Number of warp threads in 27 in. of carpet.
Plains—Fabrics without fancy features.
Plaiting—Cloth-folding.
Plate Wools—Shipped from the River Plate.
Plush—Long cut-piled fabrics.
Point Paper—Squared for designers' use.
Poplins—Cloth ribbed in weft direction.
Porcupine—Spiked roller.
Port Philip—Fine Australian wool.
Preparing—Making ready.
Press—Hydraulic or other for flattening.
Prints—Cloth printed.
Proofing—Rain or water proofing.
Prunella—A warp twill, 2-and-1.

RABBETH—Type of spindle.
Race-board—Part of loom.
Rag Flock—Generated in grinding woollen rags.
Raising—Scratching up fibre on the surface of cloth.
Ramie—A nettle fibre.
Ratch—The distance separating front and back rollers of spinning machinery.
Raw Silk—Reeled, but not thrown.
Re-combing—Twice combing.
Reed—Beating-up wires in the loom.
Reel—Arms for winding yarn in skein.
Regain—Percentage of natural moisture.
Repeat—Recurrence of design.
Repps—Fabrics ribbed weftwise.
Resists—Applied to prevent the taking of colour in places.
Retting—Fermentation process to loosen flax from the straw.
Ring-spun—Yarn from ring frames.
Rovings—Soft threads ready to become yarn.

SAKEL (Sakellaridis)—A long, fine Egyptian cotton.
Satins—Weaves concealing the intersection of the threads.
Saxony—Merino wool.
Schappe—Continental waste-silk yarn.
Schreinering—Embossing cloth with exceedingly fine lines.
Scotch Tweed—All-wool, Scottish-made.
Scouring—Washing.
Scroop—A slight crackling experienced on handling.
Scutching—Beating flax straw to remove fibre.
Sea Island—The longest and silkiest cotton.
Serges—Twilled woollens or worsteds.
Sericin—Silk gum.
Sett—Warp threads in given width of cloth.
Shade—The precise colour.
Shafts—Healds.
Shearing—(1) Wool-clipping; (2) Cropping the surface of cloth.
Shed—The parting formed between warp threads for the traverse of the shuttle.
Sheeting—Stout, wide calico.
Shive—Woody matter adhering to the fibre.
Shoddy—Long-stapled woollen waste.
Shoot—Synonym for weft.
Shot—A pick of weft.
Shuttle—Weft-carrier in loom.
Singles—Yarn of one strand.
Sinkage—Weight lost in working materials.
Size—Mucilage used on yarns.
Skin Wool—Removed from slaughtered animals.
Slasher—A sizing machine.
Slay—Part of loom carrying the reed.
Slazy—Cloth too bare, showing the structure.
Slipe—Skin wool removed by liming.
Sliver—Fibre in soft, continuous rope or ribbon.
Slubbing—Sliver lightly twisted.
Slubs—Thick places in yarn.
Smallwares—Tapes, braids, and narrow goods generally.
Snarls—Kinks in yarn.
Soft Waste—Without twist.
Solid Colour—Not a mixture colouring.
Spindle—Rotating rod around which yarn is spun.
Spinner—A producer of yarn.
Splits—Goods woven two or more in width and then cut.
Spool—A form of bobbin.
Spun Silk—Spun silk waste.
Staple—The length of fibres.
Stapled Americans—Mississippi long-fibred cotton.
Stenter—See Tenter.
Stoving—Bleaching woollens in sulphur fumes.
String—Denotes damaged place in cloth.
Strips—Cotton carding waste.
Stuffs—Dress fabrics.
Surats—Raw cotton from Bombay Presidency.
Surgical Cotton—Prepared lint.

TABBY—Plain cloth.
Tambour—Embroidered stitching.
Tapestry Carpet—Design printed, not woven.
Tappets—Cams to lift healds.
T Cloth—Common grey calico.
Tear—Ratio of top to noil.
Teazle—Thistle-head used in finishing woollens.
Teg—See Hogget.
Tender—Not strong enough.
Tenters—Frames for drying and stretching cloth.
Terry—Cloth with loop pile.
Thrums—Piece ends.
Tod—28 lb. weight.
Tops—Combed wool.
Tow—Flax combings.
Tram—Silk weft.
Tropicals—Worsteds for tropical wear.
Tsatlees—Hand-reeled China silk.
Tussah—Uncultivated silk.
Tweeds—Fancy woollens.
Twill—Diagonal woven rib.
Twiner—Mule doubling machine.
Twist—Cotton yarn for warp.
Twisting-in—Attaching ends of one warp to another.

UNIONS—Cloths having warp and weft of different materials.
Uplands—American cotton from the Southern uplands.

VAT DYES—Fast colours, developed on the fibre.
Velvet—Silks with erect warp-pile.
Velveteen—Cottons with erect weft-pile.
Venetians—Satteen warp twills.
Vicuna—Usually soft woollen cloth.
Viscose—Artificial silk from wood-pulp.
Voile—Open structure woven from hard-twisted yarn.

WARP—Longitudinal threads in cloth.
Washed Wool—Washed on the animal's back.
Waste—By-products utilisable for re-manufacture.
Waste Silk—Unreelable silk.
Weft—Transverse threads in cloth.
Weft-fork—Stop-motion on loom.
Wether Wool—Wool from two-year or older sheep.
Whipcords—Stable tweeds.
Wigans—Heavy cotton twills.
Willow—Machine for cleaning and opening fibres.
Wilton—Carpet with Brussels loops cut.
Winding—Passing yarn from hank or bobbin to bobbin.
Woof—Archaic term for weft.
Wool-dyed—Dyed in the loose.
Woollen—Yarn in which the wool fibres are intercrossed.
Wool-sorting—Dividing fleece into qualities.
Worsted—Yarn of parallel wool fibres.

YARN—Fibres bound together by twisting.
Yarn-dyed—Dyed in the yarn stage.

ZEPHYRS—Fancy cottons.

THE LEATHER TRADES

AGEING—Hanging skins that are being tawed for gloves to dry, the process occupying about a month.
Alkaline Soaking—Soaking hides in solutions of caustic soda or crystallised sodium sulphide in order to soften them.
Aluming—Preparing leather for belt laces, whip lashes, etc., by impregnating skins with alum and salt solution.
Annatto—Dye from the arnotto plant, used in currying.

BACK-STRAP—A thin leather strip inside a seam to protect it.
Bating—Steeping hides in a solution of hen or pigeon dung to render them soft and fit for tanning. See *Puering*.
Bazils—Sheepskins tanned in oak or larch bark.
Beading—The insertion of a thin double strip between two other pieces of leather so as to show the folded edge of the insertion.
Beam-house—The part of a tannery in which unhairing is done.
Belly—The part of a skin or hide that covers the belly of an animal; also, in saddlery, a piece of leather fixed to the hind pommel for the attachment of valise straps.
Bespoke—Boots or shoes which are made to order.
Bevel—The skive of a piece of leather.
Blocking—The process of wetting leather and pulling to a given shape, as in making Wellingtons.
Bloom—A whitish deposit on the grain side of leather during immersion in bark liquors.
Bottom sizing—Treating waxed leather, after blacking, with a preparation of glue and tallow.
Bottom Stuff—The leather used for soles and heels of shoes.
Bottom Width—The widest part of the fore part of a last.
Box-calf—Calfskin chrome tanned and usually grained.
Box Toe—The toe of an upper raised and stiffened during lasting; not often done now.
Brads—Square-topped nails used for boot heels.
Breeching—The part of a horse's harness that passes round the breech and enables it to back a vehicle.
Bristling—Affixing bristles to wax thread for sewing leather, as in bootmaking.
Buckskin—Leather, properly prepared from deerskins, but now often made from sheepskins.
Buffing—Scraping with a steel scraper until smooth. This is done to skins in currying, and also to soles in bootmaking.
Buff-stick—A flat piece of wood with emery one side and kid the other, used to sharpen a clicker's knives.
Button-fly—The part of a boot that has the buttonholes.
Butt—A hide of sole leather with the belly and shoulders cut away; the best part of the hide.

CALF KID—A dull-faced, soft leather tanned by alum, but now almost obsolete.
Calf Patent—Calfskins stretched and enamelled on the flesh side.
Cank—To extend a skin, during setting, with a steel sleaker.
Catechol—The tannin principle extracted from catechu, giving greenblacks with iron salts.
Catechu—Tanning material extracted from wood of the acacia, catechu, and other trees.
Caveson—A leather noseband for breaking in a horse.
Chamois—A soft leather made from the flesh-split of sheepskins by oil-dressing.
Chape—In saddlery, a metal protection for the end of a strap or belt.
Chrome-calf—Skins of calves dressed by the mineral chrome process.
Clicker—A man who cuts out shoe uppers.
Clinkers—Wrought-iron nails used for heavy boots.
Closing—Putting together the various parts of shoe uppers.
Clump—A thick sole nailed on to a boot the sole of which has worn down.
Collagen—The gelatine-producing substance which constitutes the fibre of the skin.
Consolidated Laster—An ingenious machine that lasts up boots and shoes at a very rapid rate.
Cordovan—Skins of goats and dogs, and occasionally of hogs, tanned in liquor of extract of oak bark or extract of sumac, and afterwards rubbed with oil of sesame.
Corium—The true skin; the part used to make leather.
Counter—The stiffener used at the back of a boot or shoe, made of leather, cardboard, or canvas, and placed in position between the upper and the lining.
Creasing—Forming a line for ornament down each side of a strap.
Crown Leather—Lace-leathers produced by drumming hides with fat and flour.
Crupper—A leather strap buckled to the back of a saddle, with a loop at the other end passing under the horse's tail.
Crust Stock—Skins which, after tanning, are oiled, dried out, and stored ready for finishing.
Currying—To prepare tanned hides for use by soaking, scouring, colouring, and other processes.

DELIMING—A process to remove the lime from skins.
Depilation—Removing the hair from the skin previous to tanning.
Derbies—Boots with the outside quarter cut to a point which is placed over the vamp, as in shooting-boots.
Dextrine—A gummy substance used for sticking together greasy leathers.
Divi divi—The pod of a tropical leguminous plant yielding tannin when boiled.
Drafting—Altering the curve of a portion of a boot to ensure a tension at that part to oppose any strain put upon it during wear.
Draft-plan—The outline of the foot made by pencilling round it.
Drenching—Soaking hides and stirring in a fermenting bran infusion.
Dried Hides—See *Flint Hides*.
Drum Stuffing—Rotating wet leather in a barrel or drum heated by steam or hot air, and then introducing hot grease, with which the skins become impregnated.
Dubbing—A preparation of grease used in currying.

EDGE TRIMMING—Trimming the edges of a sole preparatory to finishing.
Ellagic Acid—A white crystallised deposit found in leather, treated by the iron-blueing tannins.
Erodin—An artificial deliming agent used in tanning, consisting of gelatinous matter, peptonised by heating with acid, with the addition of phosphates.
Eyeletter—A machine for placing the eyelets in lace boots and shoes.
FACINGS—The inside strip of leather placed under or over the edge of the boot where the eyelets are, and used to support the strain caused in lacing the boot.
Fat-liquoring—Drumming skins, previously freed from an excess of water, in a weak emulsion of oil and soap to make them soft.
Feather—The reduction of the edge of an insole to prevent it curling or hurting the wearer's foot.
Fellmongering—Removing the wool from sheep and lamb skins.
Finishing—The process of knifing, rasping, sandpapering, inking, ironing, and burnishing the edges and bottoms of boots.
Fittings—The inside parts of a boot or shoe, such as topbands, facings, straps, and linings; also the pieces of leather or gutta percha used to make up parts of lasts to the required size; also different widths of a given size.
Flesh—The under portion of leather, that which on the animal comes next to the flesh; usually distinguished by a rough appearance.
Fleshing—Removing the bits of flesh, etc., from the back of a skin before tanning.
Fleshing Knife—A blunt, two-handled knife used in fleshing.
Flint Hides—Hides dried in the sun to preserve them for tanning. They become exceedingly hard; hence the name.
Forewale—The smaller roll of a horse-collar.
Fresh Hide—One taken recently from the slaughtered animal.
Frizing—Scraping the grain surface of a skin with a sharp two-handled knife on the beam.

GAMBIER—Same as *Catechu*.
Glacé Kid—Kidskins alumed and rubbed with a lustre of wax and oil, then ironed, and polished a second time.
Glassing—Rubbing waxed skins on the flesh side, after blacking, with a thick smooth glass slicker to smooth and brighten them.
Glazed Kid—American chrome kid glazed by friction under a smooth glass cylinder.
Glazing Machine—A machine for glazing American chrome kid.
Glove Kid—Skins, usually from the kid, but sometimes from the lamb, dressed by the tawing process. They are soft and supple, but spoilt by wetting.
Glucose—A sweet compound used in the basic chrome process.
Golosh—The whole-cut vamp; also an overshoe.
Grading—Passing shoe soles through a machine that sorts them according to thickness.
Grain—The top part of a skin of leather that comes nearest the epidermis, and from which the hair has been removed.
Graining—To soften and raise the grain of a skin.
Green Hide—Same as Fresh Hide.
Grounding—Scraping the flesh side of a skin with a moon knife after the skin has been dyed.

HALF SOLING—Putting a new half sole on a boot, after cutting away the part of the old one that is worn away from the toe to the waist.
Hand-sewn—The method of making a boot by hand, that consists of sewing a welt with the upper to the insole, and then afterwards stitching the outer sole to the welt.

Hauling—Drawing skins from the lime-pits, where they are placed for unhairing.
Head Knife—A heavy two-edged blade of soft steel, held by handles attached to a bar down the centre. It is used for shaving or splitting.
Head Stall—The part of a bridle that goes round the head.
Heel Builder.—A machine for building up heels lift by lift.
Heel-measure—The distance round the foot at the sharp bend in the front and round the heel.
Heel Parer—A machine for cutting the built heel to the proper shape.
Heel Plate—A metal plate on the seat of some lasts, enabling the heel to be nailed on, the plate clinching the nails.
Heel Shave—A hand tool for shaping the heel after it is built up on the boot.
Hide Mill—A machine which softens dried hides by hammering.
Hides—Skins from the backs of the larger animals, such as oxen, buffaloes, and the like.
Hinged Last—A last sawn in two, with the parts hinged together, so as to be easily drawn from a boot.
Horsing—Raising or lowering the upper at the seat when pulling it over the toe of the last.
Hyaline Layer—The thin membrane between the epidermis and the corium.
Hydrolysis—Decomposition by the action of water of the chemical compounds formed by the action of the acids of a hide with lime.

INSOLE—The inner sole of a boot, to which the upper is attached.

JIGGER—A shoemaker's tool which is used to set the welt and face of the stitch.

KERATIN—The horny tissue that forms the epidermis.
Kino—Tanning material extracted from the Indian kino-tree and other allied plants.
Kip—The skin of a small or young animal, such as a lamb or calf.
Knifing—Shaping the edges of boots to prepare them for burnishing.

LANGTRY—A design of shoe with a rounded latchet front.
Last—The model, of wood or iron, on which the boot or shoe is built up.
Laster—The man who stretches the upper round the last and attaches it with tacks to the insole. Also a machine that does this work.
Last-fitter—The man who takes a stock-shaped last and makes it up with fittings and filing to the required shape of a foot.
Last-spring—The rise or upward curve of the toe of a last.
Latchet—The tab of the front portion of the quarter of a Derby or tie-shoe.
Leaching—Preparing tannin from bark by soaking and draining.
Levant—Term used for leather with a pebbly grain like levant morocco, frequently used in bookbinding. Such leather originally came from the Levant.
Lifting or Lifts—The pieces of leather used to build up a heel.
Limepit—Pits, containing lime water, in which the hair of skins is loosened.
Liming—The process of steeping skins in lime water to loosen the hair and outside skin.
Lines of Tightness—The directions in which a skin draws tight when subjected to a pulling strain. The observance of them in cutting out is important.
Link Belt—A belt for transmitting power, made up of a number of detachable leather links.
Logwood—A colour, obtained from the logwood tree, often used in dyeing leathers.
Long Work—Boots that reach to the calf, or higher.
Looping—Making and decorating the various kinds of leather loops used in harness.

MACHINE-SEWN—Term used for boots in which the uppers, insoles, and soles are sewn together at one operation by a sole-sewing machine.
Machine-welted—Term used for a boot made on the principle of a hand-sewn boot, but with the welt and sole machine-sewn.
Mangrove Extract—One of the cheapest forms of tannin, obtained from mangrove bark.
Martingale—A strap passing between a horse's fore legs, and fastened to the girth beneath the belly and at the other end to the bit.
Memel Calf—A skin dressed on the grain side and boarded to give a fine grain.
Mimosa Bark—A material, yielding tannin, obtained from various species of acacia.
Mineral Tanning—Tanning performed with chemicals in place of vegetable tans, as in chrome leathers.
Moon Knife—A knife with a turned edge and a horizontal handle at the lower part, used in grounding.
Mordanting—Treating skins with a substance known as a mordant to fix the colour of a dye.
Morocco—Leather made properly from goatskins and tanned with sumac, but now frequently made from sheepskins.
Myrobalans—Tannins obtained from the pulp surrounding the kernel of the fruit of several Indian trees of the species Terminalia.

NAPPA LEATHER—An American oil-leather made by fulling with soft-soap.
Native Hides—Hides from home slaughter.
Neutralising—Washing chrome leather in a weak alkaline liquor to fix the chrome salt absorbed by the hide.
Non-tannins—Sugars and other carbohydrates fermented by bacteria and yeasts to organic acids, which, while they do not tan, are partly absorbed by the hide.

OAK-BARK—The oldest of all tanning materials, but now not often used exclusively.
Oakwood—The wood of the oak from which tannin is extracted. It is obtained from waste wood and sawdust.
Offal—The inferior portions of the hide, such as the belly, the cheeks, and the faces.
Ooze Calf—A soft chromed leather with a pebbly grain and fine velvety back.

PADDLE VAT—A tank containing a revolving wheel, used for tanning, washing, and colouring skins.
Paraffin Wax—A mineral oil used in drum-stuffing.
Parchment—The skin of sheep or goats prepared by mechanical processes for writing upon.
Paste-fitting—Sticking together the various parts of the upper of a boot prior to machine-stitching them together.
Patent—A leather with an enamelled surface, so called because the process was originally patented.
Pegged—Term used for boots the soles of which have been attached to the uppers with small wooden pegs.
Pelt—The skin of a small animal with the hair on it.
Perching—Fixing a skin to a bar after dyeing and stretching it with a tool.
Pickling—A process that by the use of salt and acid preserves the pelt for tanning.
Pinholes—Small faults, caused by burst blisters, that occur in skins if they are drenched too long.
Pitch—The provision in a last to accommodate the height of the heel.
Pommel—A piece of hard wood, grooved and strapped to the hand, used for graining leather and rendering it supple.
Porpoise—Leather made from the skin of the porpoise. It is very durable and tough.
Pounding up—Cutting away the bunched upper on the insole after lasting, and taking out any creases in the upper. This is done by machinery.
Pricker—See *Stitch-pricker*.
Puering—Steeping hides in a solution of dog-dung. See *Baiting*.
Puff—The small piece of skived leather placed under the toe of an upper to preserve the shape when lasted.
Puff Toe—Same as *Box Toe*.
Pulling Over—The stretching of an upper to the last preparatory to lasting.
Pulling-over Machine—A machine that pulls over the upper ready for the consolidated laster.
Punching Machine—A machine for punching the holes in boots for eyelets.
Pulling out—Freeing skins from water on a table with a blunt knife, prior to fat-liquoring them.
Pyrogallol—Tannins giving blue-blacks, and often used as inks.
Quarters—The back part of a boot or shoe.
Quebracho—A tannin extracted from the bark of a South American tree.

RACING RANGE—A strip cut from a butt of sole leather.
Ranging—Dividing a butt into ranges.
Raw Edge—The edge of a piece of leather that is laid over another without being turned in.
Raw Hide—Leather used for belts and laces, prepared by a combination of fat and vegetable tanning.
Reds—A dark brown substance deposited on leather by iron-greening tannins.
Rhatany—The root of a Peruvian plant from which tanning materials are extracted.
Riveting—Fastening the outer soles of boots to the inner soles by brass rivets; frequently used in cheap repairing.
Roans—Sheepskins with a grained face, used for linings, and also for bookbindings.
Rolling—Hardening leather by passing it between heavy rollers.
Rounding—Cutting away the outer edges of a hide.
Roundings—The poorer parts of leather thrown out when cutting up skins; the edges or skirting of skins.
Rounding Knife—The knife used in rounding.
Rounding Table—A table on which a hide is laid for rounding.
Russet-calf—The calfskin in the crust before it has been curried or blackened.
Russia Leather—Goat or sheep leather dressed with a brown birch or larch oil, which gives it a fragrant odour, and protects it from the ravages of insects.

SALTED HIDES—Hides from South America, preserved with salt.

Samming—Piling up hides after their removal from the tanpits and allowing them to stand, so as to soften by the fermentative heat.

Satin-calf—Calfskin dressed in the grain, but finely buffed to a smooth face.

Satin-hide—The split hide of the buffalo, with the grain buffed to a very fine face.

Scale—A range of sizes and fittings suitable for lasts.

Scudding—Removing remaining hairs, dirt, etc., from a hide or skin with a knife after depilation.

Scouring—Removing the bloom and smoothing the hides after they have been tanned; also smoothing the soles or heels of boots preparatory to finishing.

Scouring-machine—A machine for scouring hides; also a machine for scouring the soles and heels of boots and shoes.

Scouring-stone—A tool with two sharp edges, used in hand scouring.

Seasoning—A liquid, such as a weak solution of egg—or blood—albumen with a little milk and dye, used for slightly moistening dyed skins that have been dried, preparatory to glazing.

Seat—The portion of the boot immediately over the heel. In hand-sewn boots the seats are either pegged or sewn.

Second-lasting—Placing a turnshoe on the last a second time, after it has been sewn and turned, in order to shape it.

Sectional Lasts—Lasts made in several pieces to facilitate withdrawal from the boots when lasting has been completed.

Setting—A process that has to be carried out rapidly. The grain side is first well worked out on a flat table with a stock stone, and the flesh side then canked.

Sew Round—A shoe that is made inside out, the inseam being placed all round the sole and upper.

Shagreen—A peculiar kind of parchment prepared from the skins of the horse, ass, and camel. There is also a fish shagreen.

Shank—The waist or narrowest part of the sole of a boot.

Shoulder—The fine and tough part of a skin that formerly covered the animal's shoulder.

Shover—A leather fitting made to go down the front of a last to increase its measurement.

Sidespring—A boot with elastic gussets at each side.

Size Stick—An instrument used by the bootmaker in measuring the lengths of feet.

Sizing—Treating waxed leathers with a size made of glue and tallow after blacking.

Skin—A hide from one of the smaller variety of animals.

Skive—To bevel or reduce the edges of leather to allow one portion to lap over another.

Slabs—Under-splits of leathers cut into two or more sections.

Sleaker—A flat steel blade with a square edge, set in a wooden backing, that is grasped in both hands; used in hand scouring.

Sleaking—Using the sleaker.

Slicker—Same as *Sleaker.*

Soaking—The preliminary operation of tanning, which consists in washing away the dirt, blood, or salt in water.

Sole-sewer—The machine that sews upper, insole, and outer sole together in a machine-sewn boot.

Split—The flesh portion of a split hide.

Split Lift—A strip of leather nailed round the seat of a boot before the heel is put on.

Splitting—Dividing skins into two separate layers, as in splitting sheepskins, when the grain side is made into imitation morocco or roan, and the flesh side into chamois leather.

Staking—The process of drawing a skin over a blunt edge to stretch it and make it soft.

Standard—The first pattern for uppers of a series of sizes. Other sizes are made from the standards.

Starching—Treating butts with a glue-and-water solution previous to graining.

Stiffener—Same as *Counter.*

Stitch-pricker—An awl used to mark holes for stitching in leather, to ensure regularity.

Stocking—Softening hides in a hide mill.

Stocks—Same as *Hide Mill.*

Stoning—Sleaking butts with a stone sleaker after whitening during the currying operations.

Straights—Lasts in which the right and left feet are alike, and not specially shaped.

Stretch—The give of a leather when pulled.

Striking—Removing the bloom with a striking pin during the finishing of sole leather, a process now often performed by a machine.

Striking Pin—A two-handled tool of triangular form with three blunt edges. A butt is thrown across a beam or horse, and the workman stretches and smoothes the grain side with the striking pin.

Stuffing—Forcing fats and waxes into leather during currying. It is done by hand or by drumming.

Suède—Undressed kid which has been fluffed on the grain side with a fine rotating wheel.

Sumac—A product of the dried leaves of the sumac tree, used for tanning light-coloured leathers.

Surcingle—A girth passing round the body of a horse to keep in place a blanket or rug.

Suspenders—Contrivances for suspending hides in the tanning liquors.

Sweating—Depilation brought about by slow decomposition.

Sweat Pits—Stone or brick structures, above ground, protected from the sun's rays, in which hides are placed for sweating.

Synthetic Tannins—Coal-tar products, possessing many of the properties of natural tannins and producing very white and soft leathers.

TANNATE—A salt of tannic acid, such as tannate of iron, potassium tannate, etc.

Tanner's Beam—A convex sloping table of wood or iron, over which a hide or skin is thrown by the tanner so that he may scrape off the hair.

Tannic Acid—Same as *Tannin.*

Tannin—The astringent property found in many vegetable products, chiefly extracted from barks and seed pods and the like

Tanning Drum—A revolving drum in which hides are tanned.

Tanning Extracts—Concentrated preparations of various kinds of bark or other vegetable material.

Tannometer—A hydrometer for showing the proportion of tannin in a tanning liquor.

Tan-ooze—A watery extract of tanbark.

Tan-pickle—The liquor of a tan-pit.

Tan-press—A machine that squeezes the moisture out of wet spent tan.

Tawing—Making raw hides or skins into leather without the use of tannin, by treating them with alum, salt, or fatty products.

Throat-band—The throat-latch of a bridle—that is, the strap that passes under the horse's neck and holds the bridle in place.

Throat-strap—The upper strap of a halter, which passes round the horse's neck.

Tips—Metal fittings of horseshoe shape that are fastened to the heels of boots to save the leather.

Tongue—The leather strip that is arranged up the front of the foot beneath the eyelet holes in a lace boot or shoe.

Top-bands—The pieces of leather inside the top edges of boots.

Top-piece—The top lift of a heel.

Tops—Same as *Uppers.*

Top-sizing—A somewhat similar operation to bottom-sizing, which it follows.

Trace—The strap by which a vehicle is drawn.

Tucking—The process of shrinking oil-dressed hides by dipping them in hot soda solutions.

Tumbler—A stuffing drum.

Turning-in—The edge of leather folded under so as to show a smooth, rounded edge.

Turnshoe—A shoe that is made inside out with an insole, and afterwards turned.

UNDERLAY—The portion of leather that goes under the lap of a seam.

Unhairing—Removing the hair from a skin.

Unhairing Beam—See *Tanner's Beam.*

Unhairing Knife—A two-handled iron scraper used in unhairing.

Uppers—The portion of the boot that covers the upper part of the foot; that is, all the boot but the sole and heel.

VALONIA—The cup of a large acorn obtained from a species of oak that grows in the Near East. From it tannin is extracted.

Vamp—The front portion of a shoe.

Vatting—Washing leather, after tanning, in a warm, strong solution of bleaching extract contained in a vat. This is done in order to make the colour brighter.

Vellum—The skin of goats, kids, or calves prepared for writing or printing by exposure in lime and repeated rubbings.

WAIST—The narrow or middle part of the sole of a boot.

Wash-wheel—A revolving drum in which hides or skins are washed before tanning.

Wax-calf—The skin of the calf, tanned, curried, and blackened on the flesh side.

Waxing—Producing a deep, glossy black on leather, usually by the use of lamp-black and cod-oil or soap solution.

Weak Grain—A defect caused by too great putrefaction during unhairing, which results in a much less glossy surface.

Wellingtons—Long boots with side seams from top to bottom.

Welt—A strip of leather sewn round the boot, connecting insole and upper with the strip, to which the outer sole is then sewn.

Welted Work—Boots with welts.

Whitening—In currying, removing surplus grease from a skin with a slicker that has a turned edge.

White Whale—A leather freqently sold as porpoise, to which it is much inferior.

Wing—The part of the vamp that runs into the waist.

Winkers—The blinders or blinkers of a horse's harness.

ASTRONOMY

AEROLITE—A meteor which falls to the earth's surface.
Albireo—A double star in Cygnus.
Alcor—Star in Ursa Major.
Aldebaran—Brightest star in Taurus.
Algol—A variable star in Perseus.
Alphard—Brightest star in Hydra.
Altair—Brightest star in Aquila.
Altazimuth—Simplest telescope stand.
Altitude—Height of heavenly body from horizon in angular measurement.
Andromeda—A northern constellation.
Annular Eclipse—When eclipsed sun appears as a ring of light.
Ansa—The space between the ring and globe of Saturn.
Antares—Brightest star in Scorpio.
Aperture—Breadth of a telescope's object-glass, or principal mirror.
Aphelion—A planet's furthest distance from the sun.
Apogee—A planet's furthest distance from the earth.
Arc—A portion of a circumference.
Arcturus—Brightest star in Boötes.
Argo—A southern constellation.
Asteroid—See *planetoid*.
Auriga—A northern constellation.
Axis—The imaginary line on which a heavenly body rotates.
Azimuth—Angular distance of a heavenly body measured horizontally.

BELLATRIX—A star in Orion.
Betelgeuse—A variable star in Orion.
Bode's Law—An empirical arrangement of the planetary distances.
Bolide—A species of shooting star.
Boötes—A northern constellation.

CANIS MAJOR AND MINOR—Two southern constellations.
Canopus—Brightest star in Argo.
Capella—Brightest star in Auriga.
Cassiopeia—A northern constellation.
Castor—A bright binary star in Gemini.
Cepheus—A northern constellation.
Charles's Wain—Portion of Ursa Major.
Colure—Imaginary circle of the celestial sphere.
Comes (Comeez)—The small companion in a double star.
Comets—Gaseous bodies moving through the solar system.
Conjunction—Two or more heavenly bodies apparently near one another.
Constellation—An artificial grouping of stars by map-makers.
Co-ordinate—Elements which determine the position of a body.
Cor Caroli—Brightest star in Canes Venatici.
Corona—The sun's atmosphere.
Culmination—The meridian passage of a body.
Cusps—The extremities of a crescent, as the moon.
Cygnus—A northern constellation.

DEGREE (°)—A celestial measure, the 360th part of a circle.
Demos—One of the satellites of Mars.
Deneb—The brightest star in Cygnus.
Digit—The twelfth part of the sun or moon's diameter.
Draco—A northern constellation.

EARTHSHINE—Faint glow on unillumined part of crescent moon.
Eccentricity—The distance of a focus from the centre of an ellipse.
Eclipse—Obscuration of one heavenly body by another, or by its shadow.
Ecliptic—Sun's apparent annual path.
Egress—The passing of one body off the disc of another.
Ellipse—Shape of a planetary orbit.
Elongation—The angular distance of Mercury or Venus from the sun.
Emersion—The reappearance of a body after eclipse or occultation.
Encéladus—One of Saturn's satellites.
Epoch—Time to which calculations regarding heavenly bodies are referred.
Equation of Time—The difference between true and mean solar time.
Equator—Imaginary line running round the celestial sphere midway between the Poles.
Equinoxes—Those portions of the year when day and night are equal.
Eros—A minor planet between the earth and Mars.

FACULÆ—Bright markings on the solar disc.
Finder—Small telescope attached to larger to facilitate object finding.
Fomalhaut—The brightest star in the constellation Piscis Australis.
Fraunhofer Lines—Dark lines in the spectrum discovered by Fraunhofer.

GALAXY—The Milky Way.
Gegenschein—A luminous appearance resembling the zodiacal light.
Gibbous—A phase nearly approaching "full."
Gravity—Mutual attraction of bodies.
Gyroscope—An instrument for demonstrating the earth's rotation.

HELIACAL—Rising same time as the sun.
Heliometer—An instrument for measuring small angular distances.
Heliostat—Instrument for counteracting apparent motion of the sun.
Hercules—A northern constellation.
Hour Angle—Distance of heavenly body from meridian in hours, etc.
Hyperbola—Form of cometary orbit.

IAPETUS—One of Saturn's satellites.
Immersion—Disappearance of an object during eclipse or occultation.
Inclination—The angle made by an orbit to the ecliptic.
Inferior Conjunction—When an inferior planet approaches nearest to the sun on earth's side.
Inferior Planets—Mercury and Venus.
Ingress—The beginning of transit of one heavenly body across another.

JUNO—A minor planet.
Jupiter—The largest planet of the solar system.

KEPLER'S LAWS—The laws of planetary motions, enunciated by Kepler.

LATITUDE—The angular distance of a body from the ecliptic.
Leonids—Annual shower of shooting stars occurring about November 14.
Libration—An apparent oscillation of the moon.
Limb—Apparent edge of a heavenly body
Longitude—Angular distance of a body from the first point of Aries.
Lyra—A northern constellation.

MAGELLANIC CLOUDS—Two nebulous objects in south hemisphere.
Markab—Brightest star in Pegasus.
Mars—Planet between the earth and Jupiter.
Mercury—The innermost planet of the solar system.
Meridian—A line drawn through the heavens from north to south.
Meteor—A shooting star.
Micrometer—An instrument for making celestial measurements.
Milky Way—A belt of minute stars spanning the heavens.
Mira—A variable star in Cetus.
Mizar—A star in Ursa Major.
Motion Direct—Advancing in the order of the zodiacal signs.
Motion Retrograde—Advancing contrary to order of zodiacal signs.

NADIR—The point opposite the zenith.
Nebula—A gaseous mass in the heavens.
Neptune—The outermost planet of the solar system.
Nodes—Points where an orbit crosses the ecliptic.
Nutation—An oscillation of the earth's axis.

OCCULTATION—The hiding of a star or planet by the moon.
Opposition—When a planet crosses the meridian at midnight.
Orion—A well-known constellation.

PALLAS—A minor planet.
Parabola—Form of cometary orbit.
Parallax—An apparent shift in the place of an object.
Penumbra—The dull edge of a shadow.
Pegasus—A northern constellation.
Perigee—Nearest the earth.
Perihelion—Nearest the sun.
Perseus—A northern constellation.
Perturbation—The influence of one body on the path of another.
Phobos—A satellite of Mars.
Photosphere—The sun's visible surface.
Planetoid—A minor planet revolving between Mars and Jupiter.
Pleiades—Star group in Taurus.
Pollux—Bright star in Gemini.
Præsepe—Star group in Cancer.
Precession—A slight retrograde motion of the equinoxes.
Procyon—Bright star in Canis Minor.
Prominences—Outbursts of incandescent vapour seen at the solar limb.

REGULUS—Brightest star in Leo.
Refractor—A telescope with an object-glass.
Reflector—A telescope with a mirror in lieu of object-glass.
Rigel—Bright star in Orion.
Rill—A cleft on the moon's surface.
Rotation—Period an object takes to turn on its axis.

SATELLITE—Attendant body; a moon.
Saturn—A planet between Jupiter and Uranus.
Selenography—The study of the moon's surface.
Sickle—The front portion of Leo.
Sirius—The brightest star in the sky, in Canis Major.
Solstices—Points where the sun is northernmost or southernmost.
Southern Cross—A brilliant star group near the South Pole.
Southing—Crossing the meridian.
Spectroscope—Instrument for analysing light.
Spectrum—Analysed light.
Spica—Brightest star in Virgo.
Sun—The centre of the solar system.
Superior Conjunction—When a body approaches nearest to the sun on opposite side from the earth.
Superior Planet—A planet remoter from the sun than the earth.
Synodic—The time which a planet takes to return to the same position with respect to the sun and earth.

TELESCOPE—An instrument for bringing distant objects apparently nearer.
Terminator—The line separating day and night on the moon or a planet.
Titan—Saturn's largest moon.
Transit—Passage of a body across the meridian or a larger body.

UMBRA—Earth's shadow in a lunar eclipse; centre of a sun-spot.
Uranus—A planet of the solar system between Saturn and Neptune.
Ursa Major—A northern constellation.

VARIABLE STARS—Stars whose light varies in intensity.
Vega—Bright star in Lyra.
Venus—Planet between Mercury and the earth.
Vesta—One of the minor planets.

ZENITH—The point exactly overhead.
Zodiac—That portion of the sky through which the sun and other bodies of the solar system move. The Signs of the Zodiac (not identical with the constellations of the same name) are:—Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, Pisces.

GEOLOGY

SEE ALSO MINING AND "THE WORLD'S MINERALS" ON PAGES 3999-4014

ÆOLIAN, or AERIAL DEPOSITS—Those produced by the action of atmospheric agencies.
Amorphous—Without definite structure.
Anticline—A tilting of strata into an arch.
Aqueous Deposits—Deposits due to the action of water.
Archæan—The most ancient rocks.
Arenaceous Rocks—Sandy rocks.
Argillaceous Rocks—Clayey rocks.
Atmosphere—The gaseous envelope surrounding a planet.
Axis—The line about which a crystal or other structure displays symmetry.

BEDDING—The arrangement of rocks in layers or bedding planes.
Boss—A mass of volcanic rock pushed up to the surface.
Boulder Clay—A stiff clay full of stones and boulders, left by glacial action.

CAINOZOIC—The period of recent life.
Cambrian — The oldest Primary system.
Calcareous—Limy rocks.
Carbonaceous—Coal-bearing rocks, or those containing carbon.
Carboniferous—The fourth Primary system, including the coal measures.
Catastrophe, or Cataclysm—A convulsion of Nature which causes great and sudden geological changes.
Cleavage—The division of a rock into layers, due to pressure.
Clinometer—An instrument for measuring the slope of strata.
Colloid—A jelly-like, non-crystalline mineral structure.
Conformable—Strata laid down regularly on one another.
Contour Line—A line drawn through a series of points at the same height on a map.
Crater—The basin into which a volcanic vent opens.
Cretaceous—The latest Secondary system.
Crystalline Minerals or Rocks—Those consisting of crystals, or symmetrical structures produced by cooling or precipitation.
Crust—The upper solid portion of the earth.

DÉBRIS, or DETRITUS—The remains of rocks broken down by erosion or denudation.
Denudation—The wearing away of rock by natural agencies.
Derivative Rocks—Rocks produced by some modification of an older rock.
Devitrification—The loss of glassy characteristics, due to weathering.
Devonian, or Old Red Sandstone—The third Primary system.
Dip—The slope of strata from the horizontal.
Dislocation—A fracture in rocks accompanied by disunion of the strata.
Dyke—A vertical seam of volcanic rock, usually found standing up like a wall.

EARTHQUAKE—A rapid movement of the earth's surface.
Eocene—The oldest Tertiary system.
Epigene—Above the surface of the earth.
Erratic Blocks—Boulders transported by glaciers.
Erosion—Wearing away of rocks by natural agencies.

FAULT—A dislocation.
Fissure—A crack in rock formations.
Fluviatile—Pertaining to rivers.
Foliation—A leaf-like structure in certain minerals.
Fossil—The remains of a plant or animal preserved in stratified rocks.
Fossiliferous Rocks—Rocks which contain fossils.

GEOLOGY—The science of the earth.
Geyser—An intermittent fountain of heated water.
Glaciation—The action of glaciers on rocks.
Glacier—A river of ice.
Grey Wethers—Blocks of Eocene sandstone, known in Wiltshire as Druid stones.

HADE—The angle of a dislocation to the vertical.
Hydrosphere—The watery envelope partly surrounding the earth.
Hypogene—Subterranean.

IGNEOUS ROCKS—Those formed by the action of heat.
Impermeable—Through which water cannot penetrate.
Intrusive Rock—A rock forced through an older formation.

JOINTS—Natural divisions in rocks, usually more or less vertical.
Jurassic — The middle Secondary system.

LACUSTRINE—Pertaining to a lake.
Lagoon—A salt water lake connected with the sea.
Lake—A body of fresh or salt water entirely surrounded by land.
Lamina—A thin plate.
Lithosphere—The solid globe of the earth.
Loam—A fertile soil, consisting of clay and sand with a mixture of organic matter.

MAGMA—The viscous liquid from which the igneous rocks solidified.
Marine—Pertaining to the sea.
Marl—A calcareous clay.
Matrix—The general body of a rock in which other substances are embedded.
Mesozoic—The middle period of life on the earth.
Metamorphic Rocks—Those which have been modified by heat, pressure, or chemical action.
Mineral—A chemical element or inorganic compound of which rocks are formed.
Mineralogy—The science of minerals.
Miocene—The third Tertiary system.
Moraine—The accumulation of earthy and stony matter left by a glacier.

NEBULA—A celestial body composed of gas or of a cloud of meteorites—the raw material of stars and planets.
Neck—The solidified pipe of lava of an extinct volcano.
Neozoic—The period of recent life.

OLIGOCENE—The second Tertiary system.
Outcrop—The part of a rock stratum which emerges on the earth's surface.

PALÆOZOIC—The period of most ancient life.
Permeable—Through which water can pass.
Permian — The youngest Primary system.
Petrography—The science of rocks.
Planes—The roughly parallel divisions of rocks caused by cleavage, stratification, etc.
Pleistocene—The glacial or older Quaternary system.
Pliocene — The youngest Tertiary system.
Post-Glacial—The Human Period.
Plutonic Rocks—Those igneous rocks which have taken shape below the earth's surface.
Pre-Cambrian—The oldest system of stratified rocks.
Primary Rocks—The second oldest of the five main divisions of stratified rocks.

QUATERNARY—The most recent stratified rocks.

RIB—A kind of wall of stone.
Roches Moutonnées—Rocks rounded by glacial action so that at a distance they look like sheep.
Rock—A mass of earthy or stony matter composed of one or more simple minerals.

SEAM—A layer of mineral, usually applied to coal.
Secondary—The third of the five periods of stratified rocks.
Secular Movements — Those prolonged through many centuries or ages.
Sedimentary Rocks—Those produced by the solidification of sediments left by water.
Seismic—Relating to earthquakes.
Siliceous Rocks—Flinty rocks.
Sill—A layer of volcanic rock.
Silurian—The second Primary system.
Soil—The detritus covering the earth's surface and capable of supporting vegetable life.
Spicule—A needle-shaped body.
Strata—Layers of rock, usually more or less horizontal.
Stratified Rock—Rock arranged in definite layers.
Striation—Scratching of stones due to glacial action.
Strike—The direction of the outcrop of strata.
Subsidence—The gradual sinking of the land.
Subsoil—Consisting generally of earth and stones, intermediate between the soil and the solid rock.
Syncline—An arrangement of tilted strata in troughs.

TERTIARY — The fourth period of stratified rocks.
Throw—The vertical displacement of strata by a dislocation or fault.
Till—Boulder clay.
Triassic — The oldest Secondary system.
Tuff—Volcanic débris, often hardened into rock.

UNCONFORMITY—The disposition of a set of strata upon older ones which lie at a different angle.
Uniformitarianism — The doctrine that similar causes have been at work throughout geological history to produce the same results.
Upheaval—The slow rising of the land.

VENT—The communication between a crater and the subterranean reservoir of molten lava.
Vitreous—Glassy rocks or minerals.
Volcano—A mountain produced by the ejection of lava from the interior of the earth.
Volcanic Rocks—Igneous rocks which have solidified on the earth's surface.

WEATHERING—The modification of rocks by atmospheric or meteorological agencies.

MECHANICAL ENGINEERING

FOUNDRY WORK

ACID STEEL—Steel made from non-phosphoric ores.

Air Belt—The belt encircling a cupola, through which the blast is conveyed to the tuyeres.

Air Furnace—A furnace which utilises the natural draught of a chimney.

Alloy—A mixture of two or more metals, effected by fusion.

Aluminium—Used in numerous alloys. It exercises a cleansing effect.

Anchor—A moulder's chaplet.

Angle Board—Used by pattern-makers for planing angles, hollows, or fillets in.

Angles—Strips of triangular section used for fitting in corners in patterns, and for strengthening castings.

Annealing Oven—Used for the decarbonisation of malleable iron castings.

Apple Tree—Used for cogs of mortice wheels.

Arc Pitch—The pitch of gear wheels measured round an arc of the pitch line.

BABBITT METAL—A white metal used for lining bearings.

Back Plate—A cast-iron plate bolted to the back of a foundry box, for vertical casting.

Bare—Slightly under exact size.

Barrow Ladle, or Sulky—A foundry ladle mounted on a barrow framing.

Bars—The stays, or cross-pieces of moulding boxes.

Basic Steel—Steel made from phosphoric ores, in a converter or furnace having a basic lining (lime).

Bastard Wheel—A wheel which, bearing with another, is not of correct pitch or bevel.

Bead Sleekers—Moulder's tools for smoothing the impressions of beads.

Bed Charge—The bottom charge of coke in a cupola furnace.

Bedding-in—Moulding patterns in the same position in which they have to be cast, without a bottom box.

Beeswax—Used for coating iron patterns to prevent them from rusting.

Bellows—Employed for blowing particles of loose sand, dust, and blackening out of moulds.

Bench—Used by pattern-makers, moulders in small work, and by core-makers.

Bench Rammer—A small rammer used for moulding at the bench.

Bench Work—Work done at the bench, to distinguish it from that done on the floor.

Bevel Wheels—Toothed gears, the pitch planes of which form conic frustra.

Blackening—Charcoal dust, or plumbago, used for dusting foundry-moulds to prevent sand burning.

Blacking Bag—A muslin bag from which blackening is dusted over the surfaces of moulds.

Blacking Mill—A rotating cylinder containing rollers, or balls, which crush charcoal into dust.

Blackleading—Sometimes patterns are treated thus to facilitate their delivery.

Black Sand—The old sand of the foundry floor.

Black Wash, or Wet Blacking—A mixture of charcoal or plumbago with clay water, washed over the surfaces of moulds.

Blast—Air supplied under pressure to melting furnaces.

Blast Furnace—A furnace ranging from 80 ft. to over 100 ft. high, in which iron is reduced from its ores.

Blow—The period during which blast is being brought into a melting furnace, or the act of bringing it in.

Blower—A rotary machine in which an artificial current of air is produced by positive pressure.

Blow Holes—Holes in castings caused by the entanglement of gases in the mould at the time of pouring.

Body Core—A main core.

Body Flange—A pipe flange fitted on the body of a pattern.

Bosh—A tank of water for foundry use.

Boshes—The melting zone of a blast furnace.

Boss—A circular bearing pierced with a hole for a shaft or pin.

Bottom Board—A flat board on which a bottom box is rammed over a pattern.

Bot Stick—The iron rod which holds a stopper of clay at one end for closing the mouth of the cupola, and has at the other a point for tapping.

Box Filling—The black sand of the floor as distinguished from facing sand.

Boxing-up—Making a large pattern to enclose hollow spaces, instead of using solid timber.

Brass—An alloy of copper, tin, and zinc variously proportioned.

Brass Melting Furnace—Generally an air furnace receiving crucibles. Sometimes a reverberatory furnace for large masses.

Brass Moulding—The moulding for brass castings, which differs in some particulars from iron moulding.

Bricking-up—The building-up of the skeletons of loam moulds with bricks.

Bricks—Common bricks, fire bricks, or loam bricks, used in loam moulding and in lining furnaces.

Bronze—A mixture of copper and tin variously proportioned, or with aluminium or phosphorus.

Building-up—Constructing patterns with segmental pieces to ensure permanence of form.

Burning-on—Casting new metal on old for the purpose of repairs.

Burnt Iron—Cast iron which has become largely reduced to the condition of an oxide, and rotten.

Burnt Sand—Sand which has been subjected to intense heat, so that it has no coherence. It is used for parting joints.

CAMBER—Curving of castings and of their patterns.

Carbon—The most essential controlling element in cast iron.

Carbon Cores—Hard, strong cores made of conpressed carbon.

Carriage Ladle—A ladle mounted on a carriage.

Casting—The pouring or founding of the metal.

Casting Upright—Pouring a mould vertically with a view to secure soundness.

Cast Iron—An alloy of iron with carbon and other elements.

Cast Steel—Steel which has been melted and poured.

Centre Plates—Plates used for turning jointed patterns on, the plates being attached at the ends.

Centre Square—An instrument for finding the centre of a body without compasses.

Chalk—Used for whitening pattern-shop drawing-boards, and other purposes.

Chalk Line—A fine line chalked and strained tight, and snapped on a board to leave a straight chalk-mark for sawing by.

Chambered Core—A core enlarged about its central portion.

Changing Hook—A foundry crane hook with two bends for changing ladles of metal from one crane to another adjacent.

Chaplet—A metallic stud, or nail, or piece of hoop iron which affords support to a core independently of prints.

Chaplet Block—A block of wood which sometimes supports a chaplet nail.

Charcoal—Charcoal, when ground, is used for facing moulds.

Charge—The quantity of ore, fuel, and flux which is introduced into a cupola or blast furnace at one time.

Charging Door—The opening of a blast or reverberatory furnace through which the charges are introduced.

Check, or Register—The annular jointing between the top and bottom of loam moulds.

Chilling—Casting against cold iron.

Chord Pitch—The shortest distance between the adjacent centres of the teeth of wheels.

Chucking—Attaching work to lathe chucks.

Cinder Bed, or Coke Bed—A bed laid with cinders or coke at the bottom of a mould, into which the vents collect, and from which they are discharged.

Clay Plug—A plug of clay that closes an ingate until the basin is nearly filled.

Clay Wash—Clay diluted with water, and used for swabbing the bars of moulding boxes and lifters.

Clean Lift—A pattern delivery which does not damage the mould.

Clean Metal—Metal free from sponginess, scabs, and blow-holes.

Clearance—The space between adjacent gear-wheel teeth.

Coal Dust—Ground coal, to be mixed with sand for facings.

Coal Mill—A mill in which coal is ground into dust.

Coat—An application of loam, clay wash or wet blacking to a mould.

Cod—A mass of sand carried on a drawback, or other plate.

Cogs—The wooden teeth of mortice wheels.

Cog Wheel—A wheel with teeth of wood.

Coke—Used in cupolas and blast furnaces, and when ground, for mixing with facing sand.

Coke Baskets—Moulders' hand baskets.

Coke Bed—See *cinder bed*

Coke Mill—Same as *coal mill*

Cold Blast Iron—Iron smelted by cold blast.

Cold Shots—Small globules of cold iron enclosed in castings.

Cold Shuts—Lines of imperfect union in castings.

Collapsible Core Bar—A core bar which is made to fall inwards for ready removal, after the mould is poured.

Combined Carbon—Carbon in a condition of chemical combination with iron.

Contraction—The shrinkage of metal from the liquid state.

Contraction Rule—A rule longer than the common rule by the amount of contraction of iron, or brass.

Converter—The vessel in which Bessemer steel is made.

Cope—The top part of a loam mould.

Core—A central or internal body of sand.

Core Bar—A hollow bar on which cylindrical cores are swept up.

Core Board—A board cut to the profile of a core which is swept up against it.

Core Box—A framing within which a core is rammed.

Core Carriage—A carriage on which heavy cores are run into the stove.

Coring Up—Placing the cores in a mould.

Core Irons—Iron rods rammed in a core to afford a stiffening skeleton.

Core Oven, or Core Stove—An oven or stove in which cores are placed to be dried by heat.

Core Plate—A plate on which cores are swept up.
Core Print—A projection piece on a pattern, into the impression made by which a core is placed.
Core Ropes—Ropes or strings rammed in curved portions of a core, and withdrawn to leave vent holes.
Core Sands—Mixtures of strong sand.
Core Trestles—Trestles on which core boards and core bars are supported.
Crane—Used for lifting and turning over moulds and castings.
Crane Ladle—A heavy ladle which is slung and carried by a crane.
Cross—A double beam of the form of a St. Andrew's cross, suspended from a crane, and carrying suspension loops for moulders' work.
Crucible—Used in melting steel and copper alloys.
Crucible Cast Steel—Steel melted in a crucible.
Cupola—The furnace in which cast iron is remelted.
Cupola Hoist—A light hoist for lifting iron, coke, and limestone to the cupola platform.
Curving of Patterns—Patterns are curved in the opposite direction to that taken by their castings in cooling.

DAUBING—Lining a furnace or ladle with fire-clay.
Dead Head—A head of metal on a casting.
Dead Melting—Thorough melting.
Delivery—The withdrawal of a pattern from its mould.
Devil—An open cage in which a coke fire is lit for drying moulds.
Dog—A staple, or iron cramp.
Double Shrinkage—Two shrinkages must be allowed for when making patterns from which to cast patterns of metal.
Dowels—Pins uniting loose pieces temporarily.
Drag—The bottom box in moulding.
Draught—The taper of a pattern.
Draw—The same as *delivery*.
Drawback—A mass of sand carried on a plate, without a print.
Drawing Board—A board on which shop drawings are made to actual sizes.
Drop Bottom Cupola—A cupola in which the bottom is dropped to discharge the ashes.
Drop Print—A pocket print.
Dry Brush—A soft brush used for removing dust from moulds.
Drying—Driving off the moisture from moulds and cores by heat.
Drying Stove—A stove in which moulds and cores are dried.
Dry Sand—Strong sand, dried in the stove.
Dull Metal—Metal imperfectly melted.

EMERY WHEELS—Used for fettling castings.

FACE PLATE—A plate on which pattern work is turned.
Facing—A portion standing above the main surface of a pattern or casting.
Facing Sand—The sand which lies next a pattern.
False Core—The false core of a brass moulder corresponds generally with the drawback of the iron moulder.
Fan—A rotary machine for supplying blast to a cupola.
Feeder—A body of liquid metal which supplies shrinkage loss.
Feeding—Assisting the ingress of metal to the mould by the movement of a rod up and down in the runner.
Feeding Rod—A rod of ¼ in. or more in diameter, used for feeding.
Fettling—Removing runners, fins, and other excrescences from castings.
Fillet—An angle, or hollow.
Fin—A thin expansion of metal spreading out from mould joint.
Flask—A moulding box.
Flat Rammer—A rammer having a flat end, used for finishing.
Floor Work—Moulding done by kneeling or bending over moulds on the floor.
Flow-off Gate—A riser gate.
Fluid Metal—Metal thoroughly melted.
Flux—Lime, which unites with earthy matter, etc., present in iron ore, forming slag.
Foundry—The building in which casting is done.
Foundry Crane—A triangular framed crane, having its top member horizontal.
Foundry Pig—Grey pig, fluid when melted.
Full—Slightly oversize.
Furnace Linings—Bricks of fire clay and ganister.

GAGGERS—Prods cast on loam plates.
Ganister—Silicious sand, and fire clay used in furnace linings and steel moulds.
Gas Coke—By-product of gas works, sometimes used in brass furnaces.
Gates—Ingates, or runners, through which metal enters a mould.
Grain—The texture of metal, or of wood.
Graphitic Carbon—Free carbon, present in grey cast iron.
Green Sand—Sand which is not dried.
Green Sand Moulding—Work done in green sand.
Grey Iron—An open grained iron, only moderately strong.
Grid—An iron frame on which a core or drawback is built.
Guide Iron—An iron curved to control the movements of a strickle.
Gun Metal—An alloy of copper and tin.
Gutters—Narrow channels cut in the joint faces of moulds for the escape of gas.

HALF PATTERN—One of the halves of a jointed and dowelled pattern.
Halving—A form of flat joint uniting pattern parts.
Handing—Making pattern parts right and left.
Hand Ladle—A small ladle carried by a single shank.
Hard Coke—Furnace coke, used in cupolas.
Hard Iron—Iron which is either highly silicious or chilled.
Hard Ramming—Ramming a mould hard, to prevent risk of lumps.
Hatching—Cutting up the surface of moulds with the trowel to assist the adherence of fresh sand for mending up.
Hay Bands—Used to bind the loam in swept-up cores.
Head Metal—A supplementary mass of metal on top of a casting, to secure soundness in the latter.
Hemp—Used instead of hay bands in small cores.
Hollows—Concave portions inserted in angles of patterns to ensure strength in the castings.
Honeycombing—A state of general sponginess in a casting.
Horse Manure—Used as a binding and venting material in strong sand.
Hot Blast — Employed generally instead of cold blast for smelting iron.
Hot Metal—Metal thoroughly melted.
Hot Sand—Sand from which recently poured castings have been removed.

INGOT—A mass of metal of rectangular section which has to be remelted for castings.
Iron—Foundry iron owes its virtue to the presence of carbon and other elements.
Iron Cement—A mixture used for joints and filling blow holes.

JAGGERS—The same as *gaggers*.
Joint—The parting of a pattern or of a mould.
Joint Board—A board on which a pattern is rammed.

LADLE—The vessel which receives molten iron from the cupola, and from which it is poured into moulds.
Lagging—Building up patterns with narrow strips of wood.
Lead—Used for lining up portions of patterns.
Leather—Used for the same purpose as lead, and for hollows.
Levelling—Necessary when work is moulded by bedding in the floor.
Lift—The act of withdrawing a pattern from the mould; or the character of the draw.
Liftering—Hanging and setting lifters in the sand of moulds.
Lifters—Hooks hung from the bars of boxes to assist in supporting the sand.
Lifting Plate—A plate attached to a pattern to receive lifting screws.
Lifting Screw—A screw with an eye used in withdrawing a pattern from the mould.
Lifting Strap—A piece of hoop iron attached to deep patterns for withdrawing them by.
Lime—A flux mixed with the charges of iron and coke in the cupola.
Lime Bag—A muslin bag from which lime is dusted over the joints of moulds, to show contact.
Loading—Weighting box parts previously to pouring.
Loam—A mixture of strong sands, rendered plastic with water.
Loam Board—A board by which a loam mould is swept up.
Loam Bricks—Bricks made of loam and dried.
Loam Cake—Pieces of dried loam.
Loam Mould—A mould made in loam.
Loam Pattern—A pattern made in loam instead of in wood.
Loam Plate—A plate on which a loam mould is built.
Loosening—Rapping a pattern.
Loose Pieces—Pieces which are not fastened permanently on a pattern body, but have to be left behind in the mould.
Lug—A projecting portion.

MACHINE MOULDED WHEELS—Toothed wheels made from sectional patterns in a machine.
Machine Moulding—Moulds in which some portions of the work are done by machine.
Malleable Cast Iron—Castings which are rendered malleable by decarbonisation or annealing.
Mending-up—Making damaged portions of moulds good.
Mending-up Piece—A piece used in mending-up, as a guide for finishing the sand outlines by.
Metal Patterns—Used when large numbers of similar pieces have to be cast.
Middle Part—The central portion of a moulding box having three or more parts.
Model—Sometimes applied to denote a pattern.
Mortice Wheel—A cog wheel, or one fitted with wooden cogs.
Mould—The structure into which metal is poured.
Moulding Box—The framework in which sand is rammed for moulds.
Moulding Machines—Machines used for producing moulds.
Moulding Tub—Used by brass founders as a receptacle for sand, and over which they work.

NAILING, NAILS—Embedded in weak portions of sand as supports.

OLD SAND—Sand which has been used continuously, and become weak.

Open Joints—Boards jointed side by side, but not in actual contact.
Open Sand Work—Moulds without a covering.
Oven Coke—Hard coke.

PAINTING—Denotes the application of wet blacking to moulds.
Paper Joint—In segmental and some other work, temporarily glued joints are made by the insertion of paper.
Parallel Print—Prints are parallel when they mould sideways.
Parallel Strips—Winding strips used for levelling mould faces and planing timber by.
Paring Tools—Long thin chisels and gouges.
Parting—The separation of the parts of a mould.
Parting Sand—Burnt sand used to prevent mould joints from sticking.
Pattern—A model from which an impression is taken in sand.
Pattern Register—A list of patterns kept in a book.
Pattern Stores—The building in which patterns are stored.
Peasemeal—A cementing material between the face of a mould and the blackening.
Peg and Cup Dowells—Brass dowells driven into the joints of patterns.
Pegging Rammer—A small rammer for small moulds and intricate portions.
Phosphor Bronze—Bronze to which a little phosphorus is added.
Phosphorus—An element which renders steel and cast iron brittle. A small quantity increases the fluidity of iron.
Picker—A pointed wire used for pulling small patterns from the mould.
Pickling—Removing the hard outer skin from castings by immersion in dilute sulphuric or nitric acid.
Pig Iron—The form in which iron is cast and sold for foundry use.
Pig-Iron Breaker—An appliance or a machine for breaking pig into short lengths for remelting.
Pine—Used more than any other material for foundry patterns.
Pipe Nails—Chaplet nails, used for supporting the cores of pipes.
Pitch—The distance between the centres of contiguous teeth in cog wheels.
Pitch Circle—The circle on which the pitch is struck.
Pitch Diameter—The diameter of a pitch circle.
Pit—A hole in which deep moulds are placed for casting.
Plaster of Paris—Used in making temporary patterns, and core boxes.
Plate Moulding—Moulding off patterns attached to jointing plates.
Platen—The table of a moulding machine.
Plumbago—Used for dusting moulds.
Pocket Print—A print which is continued above the position to be occupied by the core.
Pot Metal—A very common and cheap brass.
Pouring Basin—The depression into which metal is poured first before it enters the runners.
Print—A projection which makes an impression as a guide for the insertion of a core.
Prods—Jaggers or gaggers.
Pulling-up—The tearing-up and fracture of the sand in a mould.

QUICK—Denotes a curve of small radius.

RAMMER—A tool for consolidating sand round patterns.
Rapping—Loosening a pattern preparatory to its withdrawal.
Rapping Bar—A pointed iron bar used for rapping.
Rapping Hole—The hole in which a rapping bar is inserted.
Rapping Mallet—A wooden mallet used for rapping a pattern during its withdrawal.
Rapping Plate—A metal plate attached to a pattern to receive a rapping bar.
Receiver—A vessel which collects molten metal for pouring.
Reduction—The extraction of metals from their ores by heat and chemical affinities.
Remelting—Iron, and copper alloys are remelted to render them homogeneous and stronger.
Reverberatory Furnace—An arched furnace, with natural draught, used in some foundries.
Reverse Mould—A dummy mould of plaster upon which actual moulds are rammed.
Riddle—A coarse sieve.
Riser—An overflow exit from a mould.
Rodding—Laying rods in the sand of moulds to sustain it.
Rolling over—The same as *turning over*.
Rough Coat—A first coat of loam.
Rumble—A tumbling barrel.
Rumbling—Tumbling, or fettling in a rumble.
Runner—The channel through which metal enters a mould.
Runner Pin—A pattern for forming a runner.

SAFETY LADLE—A ladle tipped by means of toothed gears.
Saggers—The packing boxes used for annealing malleable cast iron work.
Sand—The matrix of foundry moulds.
Sand Bin—A receptacle for sand.
Sand Burning—Results from pouring hot iron against sand not protected with blackening.
Sand Joint—A moulder's joint.
Sand Mixer—A machine for mixing sands.
Sand Sifter—A machine for sifting sand.
Scab—An excrescence on a casting.
Scrap—Old metal.
Scrap Heap—A receptacle for scrap.
Scull—The scaly lining left in a ladle or furnace after use.
Segmental Work—Built-up pattern work.
Self Delivery—The delivery of a pattern having hollow portions instead of by coring.
Shank Ladle—A ladle having a handle or handles, to distinguish it from a *crane ladle*.
Shellac Varnish—The varnish used for the protection of patterns.
S Hooks—Lifters.
Shrinkage—Used in the same sense as *contraction*.
Sieve—Used for sifting sand.
Skewers—Used for holding pieces loosely to patterns.
Skimmer—A flat bar employed for baying back dirt fron the surface of metal being poured.
Skimming Chamber—A chamber in the course of a runner, designed to separate the dross, and prevent its entry to the mould.
Skin—The surface of a casting.
Skin Drying—Drying the surface only of a green sand mould.
Slag—A glassy substance produced by the union of earthy matters with calcium.
Slagging—Tapping out the slag.
Sleeking—Smoothing the surface of a mould with tools.
Slicking—The same as sleeking.
Slings—The loops which sustain moulding boxes from the cross
Soft Metal—Grey iron.
Soft Ramming—Easy ramming, which often produces lumps.
Splitting—Casting pulleys and wheels in halves.
Sponginess—Openness of texture in castings.
Spray—A series of runners arranged parallel or star-shaped.
Sprigging—Nailing.
Spring Chaplet—A chaplet formed by a loop of hoop iron.
Stakes—Bars or rods driven into the floor as guides to a top box.
Stays—Bars of moulding boxes.
Steady—An appliance used for encircling patterns of columns and pipes during turning to ensure steady running.
Stopping-off—Producing a shape in the mould different from that of the pattern.
Stopping-over—Filling up pocket prints.
Strickle—A profiled piece by which sand is scraped to any desired form.
Striking Bar—The bar to which a loam board is bolted.
Striking Board—The board by which loam, or green sand, is swept up.
Stripping Plate—A plate through which a pattern is drawn in delivery.
Strong Iron—Mottled iron, in which carbon is largely in a combined state.
Strong Sand—Sand containing loam and horse manure.
Sullage—The scoriæ of metal.
Sulky—A barrow ladle.
Sulphur—A very minute proportion of this element injures cast iron, rendering it white, and is objectionable in foundry coke.
Swab—A brush used for the laying-on of clay wash, or of wet blacking.
Swab Pot—The pot which contains clay water, or wet blacking.
Sweep—A curved piece.

TACKLE—Lifting and hauling appliances.
Taper—The thinning or narrowing of patterns from above downwards.
Tap Hole—The hole from which molten metal is drawn.
Teeming—Pouring steel into moulds.
Thickness—A body of loam which represents thickness of metal.
Three-Part Box—A moulding box, comprising top, bottom, and middle.
Tile—The cover of a brass furnace.
Tinned Nails—Chaplet nails tinned to prevent rusting.
Tumbling Barrel, or Rumble—A revolving drum, in which castings are fettled.
Turning-over—Ramming the first part of a mould in the opposite position to which it has to be cast.
Turn-over Board—A board for ramming the bottom part of a mould on.
Tuyeres—The openings through which blast is directed into a blast furnace or a cupola.

VARNISH—Used for protection of patterns.
Venting—The formation of passages in moulds for the escape of gas.
Vent Wire—A rod by which vents are produced.

WASTER—A spoiled casting.
Water Bosh—A tank of water for foundry service.
Water Brush—A soft brush used for moistening the edges of moulds with water.
Weak Sand—Sand with little cohesion.
Wet Blacking—Plumbago in solution in water.
Wet Brush—A soft brush used for laying-on wet blacking.
White Iron—Iron which contains all its carbon in the combined state.
Winding Strips—Parallel strips.

YELLOW METAL—A soft variety of brass.

ZONES—The melting areas in cupolas.

ACCUMULATOR—A vessel in which water is stored under pressure for the operation of hydraulic presses.

Adamson Flanged Seam—A joint in the furnace flues of many horizontal boilers, formed by flanging the ends of the flue lengths, and riveting them together through an intermediary caulking ring.

Air Furnace—A reverberatory furnace, using the natural draught of a chimney.

Angle Bevelling Machine—A machine fitted with rolls for imparting various angles to the webs of angle sections.

Angle Iron, Angles—Rolled sections of iron and steel having two webs at right or other angles with each other.

Angle-iron Furnace—A reverberatory furnace used for heating angles.

Angle-iron Shears—Shears of V-shape, used for cutting off angles.

Angle-iron Smith—A workman whose duties are confined to the preparation of work done at the forge.

Annealing—The heating and slow cooling of iron and steel after work has been done, in order to restore ductility and homogenity.

Annealing Furnace—A reverberatory furnace used for the purpose of annealing.

Anvil—The block upon which forgings are treated. The best are of wrought-iron, welded up, and steel-faced. Many cheap anvils are produced by casting.

BANKING UP—Making up a forge fire with green coal or small coal, damped with water.

Bars—The round, or rectangular sections in which iron and steel are rolled. They are *rounds*, *squares*, and *flats*.

Beading—The burring over and rounding of the ends of boiler tubes.

Beading Tool—A drift-like tool used for beading boiler tubes.

Beak Iron, or Bick Iron—The conical projection of an anvil.

Bending Blocks—Blocks of cast iron variously shaped to serve for bending bars, sections, and plates by.

Bending Rolls—Machine rolls used for bending large plates in. The rolls have their axes either horizontal or vertical.

Bessemer Steel—Used in tyres, rails, and for many forgings.

Bevelled Iron—Flats having one or two edges bevelled.

Blazing Off—The burning of an oil or fat having a known flash-point, which corresponds with a temperature suitable for tempering springs and some other articles.

Bleeding—The presence of red rust on the plates of boilers, which indicates corrosion within the plates.

Blisters—A defect in plates due to the entanglement of slag or scale in the bloom previous to rolling.

Blue Heat—Corresponds with a stage between a low red and a black heat, at which, if severe work is done on steel and iron, serious loss of ductility and strength results.

Boiler—The vessel in which steam is generated by the action of heat.

Boiler Fittings—Sundry parts which have to be attached to a boiler; as doors, seatings, bridge, fire-box, &c.

Boiler Flues—The furnaces, or the brickwork, or smoke flues.

Boiler Flue Flange Drilling Machines—Machines for drilling the rivet holes in the flanges of Adamson seams.

Boiler Prover—A force-pump, with gauge, used for testing boilers by water pressure.

Boiler Scaling—Chipping the hard deposits from the interiors of boilers with a scaling hammer.

Boiler Shell—The outer body, as distinct from the furnace.

Boiler Shell Drilling Machines—Machines for drilling the rivet holes in shell plates, generally after the plates are all fitted in series.

Boiler Shop—The shop in which boilers are made. Its equipment consists chiefly of heavy machinery and forges.

Boiler Smithy—The department in which the forged work is done by the angle iron smiths.

Boiler Stays—Rods or tubes used for reinforcing the flat surfaces of steam boilers.

Boiler Tubes—Fire tubes in the locomotive type; water tubes in the water-tube type.

Bolster—A ring upon which holes are punched, and through which the burr is pushed.

Bolt Machine—A forging machine in which bolts are formed by rapid reduction in concave dies.

Borax—Used as a flux in welding steel and iron.

Bosh—The water tank in which the smith cools and quenches work.

Bossing—Forming bosses on forgings.

Bowling Hoop—An expansion ring of arched section used in furnace tubes.

Box Girder—A girder having four sides enclosing a hollow rectangle.

Bracings—Arrangements of bars in plated work which change the direction of stresses, so reinforcing otherwise weak members.

Brands—Trade marks used to denote qualities of iron and steel, and the houses from which they are sent.

Brick Arch—The arch in a locomotive fire-box which deflects the gases backward before they pass into the fire tubes.

Bricked-up Fire—A hollow fire enclosed with bricks, in which rolled sections are heated for welding, and by which they are prevented from contact with the fuel.

Bridge—The barrier placed at the back of the fire-grate in a horizontal boiler to promote combustion.

Buckle—A state of unequal tension in plates.

Bulb Sections—Bars, angles, and tees, having one edge thickened or beaded.

Bulldozer—A machine which presses work into dies by means of a reciprocating ram.

Burnt Iron and Steel—Metal which has been overheated at the forge, and injured thereby.

Burr—The piece removed by a punch.

Butt Joints—Joints that abut by their edges, and then are covered by and riveted through butt straps.

Butt Welding—The welding of joints brought into simple opposition.

CASE HARDENING—Imparting surface hardness to iron and steel by prolonged contact with bones, leather, charcoal, or ferro-prussiate of potash, at a red heat.

Caulking—Burring up the edges of riveted plates with a caulking tool to render the seams watertight.

Caulking Ring, or Strip—Wrought-iron or steel inserted in a joint to provide for caulking against.

Channels—Rolled sections the sectional form of which is that of three sides of a rectangle.

Chipping Chisel—A tool used for cutting iron and steel while cold.

Chisels—Used under the name of cold and hot setts.

Chisel Rod—Rod from which cold chisels are made, being of the same section as the chisels.

Clamps—Used for holding pieces of work temporarily.

Closing—Turning over the tail of a rivet, or the jointing of a weld.

Cold Chisel—A *chipping chisel.*

Cold Saw—A circular saw used for cutting off bars and rolled sections without heating them.

Cold-short—Signifies a condition in wrought-iron and steel in which it cannot be worked below a dull-red heat without risk of fracture.

Cold Tests—The testing of specimens of iron and steel while cold by bending and drifting them.

Collapsing Pressure—The pressure to which boiler furnaces are subjected, tending to force them inwards and crumple them.

Conical Mandrel—An appliance, circular in plan, and a conic frustum in elevation, around which rings of different sizes are bent and corrected.

Conical Tubes—The Galloway tubes used in the furnaces of many steam boilers.

DABBING ON—Making a weld by the simple contact of flat faces.

Die-Forging—Making forgings by stamping them into matrices or dies of hard metal.

Dolly—An appliance held up under a rivet head while the tail is being closed.

Drawing Down—The act of reducing portions of forgings by hammer blows.

Drift—A tapered tool used for enlarging holes.

Drilled Holes—These are used in preference to punched holes in high-class work.

Drop Forging—The practice of *die forging* when done under drop hammers.

Ductility—The capacity of metals of being extended considerably before fracture occurs.

ELASTIC LIMIT—The limit beyond which a body will not return to its original length on removal of stress.

Elongation—The amount of extension of a body under stress, generally reckoned at the point of fracture.

Envelopes—The forms of the plates required to enclose a body of any shape or dimensions.

Expanding—Specifically, enlarging the ends of fire tubes to make them steam tight.

Extras—Charges above the usual rates, made when the dimensions or shapes of plates, bars, or sections, involve increased expense in manufacture.

FAGGOT, or FAGGOTED SCRAP—Separate odds and ends of wrought-iron brought to a welding heat and consolidated by hammering.

Faggoting, or Piling—Preparing *faggoted scrap.*

Ferrules—Rings inserted in the ends of many fire tubes to protect the ends of the tubes from the action of the fire.

Fibre—The structure of wrought-iron which is developed during rolling.

Fire-box—The furnace of a locomotive or a vertical boiler.

Flanging—Producing flanges by bending over the edges of plates.

Flats—Bars, the section of which is rectangular but not square.

Flatters—A species of hammer struck by a sledge and used to impart a neat finish to plain surfaces.

Flux—Powdered sand and borax are fluxes used by smiths when making welds.
Forge—An open fire carried on a low platform, and surmounted by a hood and chimney.
Forge Tests—Rough bending and drifting tests made on specimens at the forge.
Forging—The practice of producing shapes in malleable metal at the anvil.
Fullers—Tools having convex edges, struck by a sledge and used for drawing down.
Fullering—The process of drawing down by a fuller. Also broad finishing following caulking.

GALLOWAY BOILER—A modification of the Lancashire type, having the two flues united in one at the rear, and fitted with Galloway tubes.
Galloway Tubes—Cross water-tubes of conical form.
Gap Gauge—A plate gauge having its edges notched to standard widths for measuring work during forging.
Gaseous Fuel—Used for heating reverberatory and rivet furnaces.
Girder—A beam which occurs in numerous designs.
Girder Stays—The bridge stays that reinforce the top of a locomotive fire-box.
Glut—A strip of square or triangular section used for welds.
Glut Weld—A weld made with a glut strip. It is both a butt and a V-weld.
Gusset Stay—A diagonal boiler-stay made of plate and angle.

HAMMER—A percussive type of tool which includes hand, holding-up, set, and sledge groups.
Hammerman—A smith's striker who wields the sledge.
Hammer Shaft—The handle of a sledge.
Hardening—The result of heating steel and quenching it in liquid suddenly.
Heat—Making a mass of metal hot for the purpose of forging is termed *taking a heat.*
Heater—A white-hot lump of metal placed in contact with plated work at a locality where slight correction is required.
H-Irons—*Joist sections.*
Holding-up Hammer—A hammer held under a rivet head while the tail is being closed.
Hollow Fire—A smith's fire banked round to enclose a hollow space clear of fuel.
Hollow Tools—*Swages.*
Hot Saw—A circular saw which cuts red-hot metal.
Hot Sett—A smith's chisel ground with a keen edge to sever hot metal.
Hydraulic Flanging, and Forging—Flanging and forging done on dies actuated by hydraulic presses.
Hydraulic Test—A pressure test for steam boilers.
INTERNALLY FIRED BOILER—A steam boiler having its furnaces enclosed within the shell.
Iron—Used in the form of bars, plates, and rolled sections.

JOIST SECTIONS—Rolled sections in iron and steel of the form of the letter H.
Jumping-up—*Upsetting.*
Jump Weld—A *butt weld.*

LAMINATION—A condition of iron plates the layers of which are imperfectly united.
Lap Riveting—The union of overlapping edges by rivets.
Lap Weld—A weld joint made by the overlapping of edges.
Letting down—Lowering the temperature of steel from the hardening to the tempering heat.
Levelling Block—An iron block or table on which plates are levelled by hammer blows.
Limiting Dimensions—The maximum dimensions in which bars, plates, and rolled sections are manufactured.

MALLEABLE IRON—Wrought iron.
Mandrel—A bar of round or other section around which an eye or ring is bent or corrected.
Mates—The men who work together, as the smith and his striker.
Monkey—A kind of heavy hammer suspended and swung by a rope.
Multiple Machines—Machines which embody provision for punching or for drilling a number of holes simultaneously.

OLIVER—An old-fashioned hammer operated by a treadle and spring pole.
Overall—An aggregate dimension, the sum of a number of smaller ones in series.

PAN HEAD RIVET—One the head of which has the section of a conic frustum.
Pendulum Hammer—A monkey.
Piling—Fagotting.
Planed Edges—These are adopted on high-class work to ensure smooth edges and good fitting.
Plate Furnace—A reverberatory furnace.
Plate Gauge—A notched gauge for measuring the thicknesses of plates.
Plates—Rolled material in which the length and width greatly exceed the thickness.
Plating—The working up of plates into girders and boilers.
Porter Bar—An extension on a forging, held in the hands of the smith.
Punch—A tool used for driving a hole through a forging.

QUENCHING—Thrusting heated steel into water or oil to effect hardening or tempering.

RED HEAT—Denotes the colour as seen in a dull light, as the shadow of a forge or wall.
Red-shortness—A condition in which iron and steel cannot be worked at a red heat without fracturing.
Reduction of Area—The diminution in cross section which takes place at the point of fracture of a bar subjected to tensile stress.
Reverberatory Furnace—An arched furnace in which work is heated by incandescent gases apart from contact with the fuel.
Rivet—A means of union between two or more pieces, effected by enlargements at both ends of a parallel shank, or pin inserted through a hole.
Rods—Bars of iron or steel of various small sections.
Rolls—Machines used either for bending plates to curves or for flattening them in true planes.
Rounds—Bars of circular cross section.

SAND—Used as a flux in welding wrought-iron.
Sawing—Rolled sections are sawn to lengths with economy of material and time, and the advantage of leaving smooth ends.
Scale—The incrustation that forms in steam boilers.
Scaling—Chipping off boiler scale with a chisel-like scaling hammer.
Scarf Weld—A lap weld in which the edges in contact are sloped or tapered.
Seam—A lap joint, or a flanged seam in a furnace.
Seating—An intermediate fitting on a boiler shell to receive a fitting or mounting.
Sections—Non-plane forms in which iron and steel are rolled.
Setts—Smith's chisels.
Sett Hammer—A broad hammer which is struck by a sledge.
Shearing—Cutting off iron or steel with a scissor-like action.
Sheets—Manufactured materials of large area, but thinner than plates, or below ¼ in. in thickness.
Ship Plates—The commoner kinds of manufactured steel plates.
Shrinkage—Allowance for shrinkage of forgings has to be made in smith's dies.
Sketch Plates—Plates cut to special shapes at the steel works and for which extra prices are charged.
Sledge—A heavy hammer having a long handle to permit of swinging it round in a circle.
Snap—A steel die used for imparting a neat finish to rivet tails.
Snaphead Rivet—One having a head semicircular in section.
Squares—Bars square in cross section.
Stays—Used for stiffening the flat plates of boilers.
Stay Tap—A long tap used for screwing holes in fire-boxes.
Stay Tubes—Smoke tubes which also fulfil the function of stays.
Steam Hammer—Used largely in the heavy work of the smithy.
Steel—Mild steels, or those low in carbon, are used by smiths. They include Open Hearth and Bessemer products. Carbon steels are chiefly used for cutting tools.
Swage Block—A rectangular block containing numerous bottom swages, with holes for bending.
Swages—Tools for imparting shapes to forgings. Called top and bottom tools.
Swaging—Drawing down.

TEES—Rolled sections having the form of the letter T.
Telescopic Plating—Relates to cylindrical boiler-shells the rings of which are conic frustra.
Tempering—Hardening carried to a certain stage only, less than the maximum possible.
Temper Tests—Tests made on hardened materials to ascertain their ductility and strength.
Templet—A strip, plate, or framing used for marking out work from.
Templet Maker—A boilermaker whose duties are restricted to the preparation of templets.
Thinning—Corners of boiler plates are thinned where adjacent plates overlap.
Tongs—Used in various forms at the forge and power hammers.
Tongue Joint—A V-joint made for welding.
Tube Expander—An appliance used for tightening the ends of smoke tubes in their tube plates.
Tubing—Inserting tubes in boilers.
Tuyere—The opening through which blast is delivered to a forge.

UNITED INCHES—The total section in square inches of a rolled angle, channel, joist, or tee.
Upending—Turning a bar into a position with its axis vertically.
Upsetting—Enlarging a portion of a bar by jumping it endwise.

VEE WELD—A weld joint in the shape of the letter V.

WASHING-OUT—Periodical cleaning of boilers with a jet of water.
Welding—Making joints between heated metals and alloys without any cementing materials or extraneous means of union.
Wrought Iron—A comparatively pure iron prepared by puddling.

YORKSHIRE IRON—The purest brands of wrought iron, prepared in Yorkshire

ZEDS—Rolled sections having the shape of the letter Z.

MACHINE & FITTING-SHOP TERMS

THIS DICTIONARY EMBRACES ONLY OPERATIONS CARRIED ON

ADJUSTABLE STRIPS — Metal strips by which compensation for wear of machine slides is effected.

Adjustments—Slight movements and corrections effected during the setting of work in machines, and during its subsequent erection.

Angle Plate—A casting having two faces at right or other angles, and used for the attachment of work on machines.

Angles of Tools—The angles included between the two faces of cutting tools. They range from just below 90° to about 20°.

Angular-hole Drilling — Producing square, triangular, and other pentagonal holes by means of a cutter, which is moved in a path corresponding with the shape in plan of the hole.

Angular Thread—A screw thread, the section of which is an acute angle, as distinguished from a square thread.

Annealing—Softening hard steel to relieve it of internal tension, or to render it easy to machine.

Arbor—A spindle or mandrel for holding cutters or work upon.

Arboring—Facing a boss around a hole, with a cutter termed an *arboring tool* held in a stem,

Arc of Contact—The distance occupied by a pair of gear teeth in mutual contact, the measurement being taken on the pitch line.

Arc Pitch—The pitch of gear teeth measured round the arc of the pitch line.

Automatic—A movement, operation, or arrest of motion, embodied in a moving mechanism without direct intervention of the attendant.

Axial Pitch—The pitch of a single helix in a multiple-threaded screw, measured in the longitudinal axis.

BACKING OFF—Imparting clearance back from the cutting edges of tools and cutters. Applied specifically to milling cutters, reamers, and taps. Also termed *relieving*.

Back Steady—A support for long, slender work being turned in the lathe, or to similar work being ground. It may be a fixed or a travelling steady.

Bare—Signifies that a dimension is very slightly below absolutely correct dimensions.

Bedding — Making a proper fit of an element of mechanism on another, or of a mechanism on its foundation.

Bench—A bench provided with a vice and drawer is used by fitters. It has a timber top carried on supports of iron or wood.

Between Centres—Setting work for turning or grinding between the point centres of the fast and loose headstocks.

Bevel Gears—Toothed gears, the pitch planes of which are conic frustra.

Black Bars—Bars of iron or steel used as they leave the rolls.

Black Holes—Cored or forged holes, as distinguished from those which are drilled.

Black Nuts — Nuts which are not machined or polished.

Black Work—Castings and forgings which are not machined.

Blank — A piece of metal or alloy machined in readiness for subsequent detailed operations in other machines.

Blank Flange—A flange which closes the end of a pipe.

Bob — The weight on the end of a plumb line. A polishing bob.

Bolt — A screwed fastening having a head solid with the shank, and a nut tapped to fit the screwed end.

Bore—A hole. To *machine* a hole is to bore it.

Boring—Usually the enlargement of a hole already existing.

Boring Collar—A cone plate.

Borings—The chips removed by a drill or boring tool.

Boss — A circular piece through which a hole is made. The boss gives the necessary depth or thickness to the hole.

Bossing — Turning the outsides of bosses in a lathe, a drilling, or a boring machine.

Bracket—An angular casting or forging which carries some form of bearing or anchorage.

Brasses—The loose linings of shaft bearings made in that alloy or in gunmetal.

Brass Work—Steam or water fittings made in the copper alloys.

Bright Bars—Bars which are planished or polished, so that they have not to be turned in the lathes and automatics, except where reduction is necessary.

Bright Nuts—Nuts which have been machined and polished.

Bright Work — Work which is machined and polished.

Buff Wheel — A polishing wheel of wood covered with leather or emery-powder. The work is termed *buffing*.

Burnisher—A piece of smooth steel, or a half-round file with the teeth ground out. It is used for polishing filed work by friction, termed *burnishing*.

Bush—The internal lining of a bearing. It is of copper alloy or a white metal, and is fitted by driving in, termed *bushing*.

CAP — The cover of a divided shaft bearing.

Card Wire—A brush made of steel wires used for cleaning the teeth of files.

Carrier—A looped piece of steel which clips an object to be driven between centres. Also termed a *dog*. See *driver*.

Cast Steel—Used for cutting tools in all shops.

Catch Plate—A small face plate which holds a driver. See *driver*.

Centre Line—Dimensions on circular and other bodies are generally taken from centre lines, which are the first dimensions to be laid down.

Centre Pops—Dots marked by a centre punch along the course of dimension lines.

Centre Punch—A pointed tool struck by a hammer to produce shallow conical depressions, or pops, and centres.

Centres — The mathematical point whence circles are described. The term also signifies the conical supports used in lathes and other machines for the support of work, either revolving or fixed.

Centring — Marking the centres on shafts, bars, and other work.

Chalk—Used for whitening the rough surfaces of castings and forgings, to show up the lines and centres scribed by the liner-off.

Chatter—Vibration during machine operations due to insufficient rigidity of the tool, work, or machine.

Checking In—Fitting parts one within the other by a projection and a seating. Also termed *registering*.

Check Nut—A lock nut.

Chipping—Cutting metal with a cold chisel driven with hammer blows.

Chipping Strips — Strips standing slightly above a broad surface, to be levelled by chipping, instead of by cutting over the whole area of the surface.

Chord Pitch — The shortest distance between the centres of adjacent teeth of gear wheels.

Chucking—The attachment of work to lathe chucks or holders.

Chucking Reamer—A reamer with a parallel shank to be held in a self-centring chuck.

Circular Nut—A round nut with holes drilled in it for a tommy. Used on many machine spindles.

Circular Pitch—Equals the division of the circumference of the pitch line of a wheel by the number of its teeth.

Clams—The soft loose jaws of vices.

Clean Cut—A cut surface which is smooth and not striated in any way.

Coarse Feed—A large relative amount of traverse imparted to a cutting tool.

Cold Chisel—A chipping chisel.

Collar—A ring encircling a shaft or spindle.

Cutter—A small loose cutting tool fixed in a bar instead of being provided with a solid shank.

Cutting Angle—The angle included between the two faces of a cutting tool.

DEAD LEVEL—Absolutely level.

Dead Size — Work produced to an exact dimension.

Diametral Pitch—Equals the number of teeth in a wheel to one inch of the pitch diameter.

Dog—A carrier. Jaw of a lathe chuck.

Double-threaded Screw — A screw with two helices half a pitch apart.

Draw Filing—Smoothing a surface by working a file along it nearly at a right angle, and parallel with the work.

Drawing-on — Pulling wheels over their axles.

Drilling Templet—A templet of sheet or cast metal having holes in it as guides for drilling by.

Drip Can — A can containing soapy water which drips on the points of a cutting tool, so lubricating and keeping it cool.

Driven—A wheel or pulley which is actuated by another.

Driver — A wheel or pulley which actuates another, or others. An appliance for rotating lathe work.

Driving Fit—A shaft or bush which fits in such a way that hammer blows are required to drive it into place.

Drum—A wide belt pulley; also a hoisting barrel.

Drunken Screw — A screw thread which has a wavy outline.

EMERY — Used for abrading and polishing, in the form of paper, cloth, powder, and consolidated in the form of wheels.

Erecting—The final putting together of mechanisms, following the preparation of their individual sections in other departments.

Even Pitch—The pitch of a screw being cut in the lathe is even when it has the same number of threads as the lead screw, or some aliquot parts of the same.

Expanding Mandrel — A mandrel capable of slight enlargement to suit bores of different sizes.

External Thread—A screw cut on the outside of a cylinder.

FACING—Turning a plane surface. A definite area standing above the general surface of a casting, or forging.

Fair or Flush—Signifies that surfaces are in one plane.

False Key—A key in the form of a pin driven into a hole drilled half way into a spindle and half way into the bore.

Feed—The amount of traverse of a tool, or work, during cutting

Feed Screw—A screw which imparts feed to a machine tool.
Female—A recessed or internal portion of a fitting, as a female gauge, or female screw.
Fine Feed—A small amount of traverse imparted to a tool in a machine.
Finishing Cut—The removal of the last portion of metal from a piece of work, being usually a slight amount.
Fitting—The minor adjustments of pieces of work previously prepared in other departments.
Flange—An expansion or extension on a casting or forging, used as a means of attachment with screw bolts.
Flesh Side—The rough side of leather belts.
Following Steady — A travelling stay. See *back steady*.
Form, or Former—A templet or guide by which a tool is controlled in producing work of irregular outlines.
Fractional Pitches—In screw cutting, pitches which are not aliquot parts of the pitch of the lead screw of the lathe.
Frosting—Light scraping done at various angles for good appearance.
Full — Signifies that a dimension is slightly over an absolute dimension.
Full-size Drawing—One that represents the actual dimensions of an object.
Full Thread—A thread which is cut to its proper depth.

GAS THREADS—Screw threads of finer pitch than the Whitworth, and made in a much smaller range of number of threads per inch.
Gauging—Measuring work by methods of contact instead of by a rule.
Gears—Any arrangements for the production of motion, as belts, toothed wheels, valve motions, etc.
Gear Wheels—Toothed wheels.
Glut — A block by which pressure is imparted, or by which wear is taken up, or a false key.
Grain Side — The smooth side of leather belting.
Grinding—Usually understood as that done on emery-wheel grinding machines with precision movements.
Grindstone—Used chiefly for grinding cutting tools with single edges.
Gromet—A washer made of spun yarn, in the form of a ring, used in making water-tight joints under boltheads.

HACKING—Truing a grindstone with a chisel-like hammer.
Hard Metal—Metal which is tooled with difficulty.
Heating — The rise in temperature of journals and their bearings, due to insufficient lubrication.
Heavy Cut — A deep cut, combined with a coarse feed.
High-speed Tools — Tools of self-hardening steel that cut rapidly, and which are not injured when working at a high temperature.
Honing—Imparting a fine edge to a cutting tool on a hone or oil stone, subsequent to grinding.
Hub—A *boss*.
Hunting Cog—An extra tooth in one gear wheel of a pair, to prevent the same teeth coming together regularly into engagement.

IDLER or **IDLE WHEEL** — One which changes the direction of motion or fills a space, without affecting velocity ratios.
In Gear—Toothed wheels having their teeth intimately engaged are in gear.
In Line—Signifies numerous centres or facings in one horizontal plane.
Insertion—Sheets inserted between flanges to render metallic joints steam tight.
Interchangeable—The fitting of identical parts as they leave machines, without any correction by hand.

JACKING UP—The lifting and adjusting heavy work through small distances by the erectors.
Jam Nut—A lock nut.
Jenny—A short crowbar, or pinch bar.

KEYING UP — Securing wheels and pulleys to their axles by the insertion of keys.
Key Bed, or Key Seat—The groove formed for the reception of a key.
Keywaying—Cutting keyways.
Kink — An abrupt bend or angle in a piece of metal.

LAGGING—Covering engine cylinders with a casing of sheet metal, or of strips of wood.
Lap — A body of lead, tin, or wood charged with emery powder.
Lapping—Grinding and polishing by means of a lap.
Lath—A strip of wood used for taking a dimension.
Lathe Dog—A *carrier*.
Lathe Work—The work of the turnery.
Lead Hammer—Used for hammering polished metal without bruising it.
Lead Screw—The lathe screw, the pitch of which is the first factor in screw cutting.
Left Hand—Relates to the direction of some screw threads, of spirals of drills, and of bending in single-edged tools.
Light Cut—The removal of a small quantity of metal in a machine.
Lining Off, or Lining Out—Marking the working lines on castings and forgings as a guide for the turners and machinists.
Live Spindle—A spindle which rotates. Specifically the spindle of a lathe driving headstock.
Loose Centres—Machine centres.

MACHINE TOOL—A machine by which cutting tools are operated by power.
Machining — Cutting metal by the aid of machine tools of all kinds.
Main—The principal element, as main belt, main pulley, main screw, etc.
Male—An external element, as a male gauge, male screw.
Mandrel, or Mandril—A spindle on which bored work is carried for turning. Also an *arbor*. The lathe spindle.
Marking Off—The same as *lining off*.
Marking-off Table — A cast-iron table, on which work is marked out.
Milling—Shaping metal with milling cutters. Knurling the heads of screws.
Multiple Cutting — Machine operations employing several tools simultaneously.

NOSE—The front end of a spindle or mandrel.

OIL FEED—The means adopted for feeding oil to bearings.
Oil Grooves—Grooves cut in the faces of journal bearings to distribute the oil over the journal surface.
Out of Gear — Toothed gears having their teeth disengaged.
Out of Truth—Denotes a condition of inaccuracy in work.
Over All—A dimension which is the sum of numerous smaller dimensions in one plane.

PICKLING—Immersing castings in dilute sulphuric and nitric acids to remove scale previous to machining.
Pitch—The distance between centres of adjacent wheel teeth measured on the pitch line.
Pitch Chain — Chain composed of flat links. Used for much machine driving.
Pitch Line—Corresponds with the velocity lines of toothed wheels.
Plumb—Truly vertical.
Poker Filing—Draw filing.
Press Fit—A fitting of parts that requires considerable pressure.
Prising—Turning or moving an object with a crowbar.

RAKE—The angles of cutting tools; as front, bottom, or side rake.
Reamering—Smoothing and finishing drilled holes with reamers.
Reboring — Smoothing, with enlargement of the bores of cylinders which have become inaccurate by wear.
Rechucking — Putting work into a new position in a lathe chuck to present a fresh portion for turning.
Resetting—Turning a piece of work into a new position in a machine to present a fresh portion for tooling.
Roughing Cut—A first cut taken on a casting or forging. It is coarse and heavy by comparison with the finishing cut.
Rust Joint—A water-tight joint made between iron and iron. Iron borings and sal-ammoniac are used.

SCRAPING—A finishing operation following filing, or planing. It is adopted when very true plane surfaces are required, as for machine slides.
Screw Cutting—Generally denotes the cutting of screws in a lathe, with a single tool.
Screwing—The cutting of screws with dies in stocks, or in screwing or automatic machines.
Scribing—Marking lines with a scriber point held in the hand, or in a scribing block, or surface gauge.
Self Acting — Relates to automatic movements in machine tools.
Sliding Fit — A mutual fitting of parts which permits of easy sliding, but without appreciable slackness or slop.
Soapsuds—Soft soap used for the lubrication of cutting tools.
Soda—Used in water for the lubrication of grinding work to prevent rusting.
Solid Tools — Tools with shanks, as distinguished from cutters.
Speeding—Calculating the speeds of pulleys, gears, and their sizes.
Sponge Cloths—Used for wiping oil from machines and work.
Straining Line—A fine wire strained between points to obtain a true plane test, for setting or checking the alignment of objects.
Surfacing—The same as *facing*.

TAKING UP—The making of adjustments to compensate for the wear of slides and other elements.
Tapping — Cutting internal screw threads with screw taps.
Tapping Hole—A hole drilled to the size of the bottom of a screw thread to be cut in the hole. Also the operation of cutting the thread.
Templet—A pattern from which a piece of work is lined out or machined.
Tommy—A round bar used for insertion in the holes in circular nuts to turn them by.
Tool Holder—A bar for holding and operating loose cutters.
Transverse Cut—Cutting done at right angles with the axis of a piece of work.
Truth—Accuracy in machining and fitting.
Turning—Includes the production of all plain external cylindrical surfaces, and plane faces in lathes of all kinds.
Turnings—The shavings and comminuted chips removed in lathes.
Turret Work—All work done in turret lathes and automatics.

VEES, VEE STRIPS—Angular strips by which adjustments are effected to compensate for wear.

WIRE EDGE—The slight arris which is turned over in sharpening a cutting tool.
Work—Commonly used as a noun, to denote any piece on which operations are being performed.

MACHINE TOOL PRACTICE

SEE ALSO MACHINE AND FITTING-SHOP TERMS

ADJUSTING SCREWS—Used for moving slides and for setting parts to definite positions.

Aligning — Getting parts in line, such as lathe spindles, etc.

All-gear Head—A lathe head without belt stepped cones, but gears only, to obtain the speed changes.

Apron—The part of a lathe carriage which hangs down in front and carries the clasp-nut and gears for sliding and surfacing.

Axle-grinding Machine—A design somewhat resembling that of a lathe, but with two grinding heads instead of turning rests.

Axle-turning Lathe—Used for rapidly finishing railway axles, usually turning both journals simultaneously.

BABBITT METAL — Employed largely for spindle bearings.

Back Centre—The hinder centre on the poppet in lathes and grinders.

Back-gear—Toothed wheels used to gain power and transmit it back to a spindle.

Backing-off Lathe—One with a reciprocating slide-rest, to cut the clearance behind the teeth of cutters.

Backshaft — The feed-shaft when placed at the back of a lathe-bed.

Ball-turning Rest—A swivelling slide-rest for turning spherical portions.

Band-saw Machines—Largely employed for cutting metal.

Bed—Any base or lower portion on which slides are set or moved.

Bell Chuck—A hollow chuck in which work is gripped with a number of set-screws set radially. Also termed *cup chuck*.

Belt Polishing Machine—A type on which runs an endless belt charged with polishing material, adapted to go into curves which could not be touched by wheels.

Belt Shipper—A handle moving forks which "strike" or push a driving belt from one pulley to another.

Bench—A prefix applied to certain small machines, as bench drilling machine, bench lathe, bench grinder, which are not fastened on independent standards.

Bevel Gear Cutting Machines—These use either rotary cutters or, with more accurate results, planer tools.

Bolt-screwing Machine, or Bolt Cutter—One which cuts the threads on bolts, revolving in a spindle, by means of dies in a sliding carriage, or vice versâ.

Boring—Performed either in the lathe or in special machines.

Boring Bar—A cylindrical bar in which boring cutters are fixed. The bar may have a large head to carry cutters; the head may slide instead of moving the work.

Boring Head—A cylindrical head carrying a number of cutters around its periphery.

Boring Lathe—One used for preparing wheels for turning. It only bores and faces the hub. A slide-rest or a special poppet is fitted.

Boring Machines—Either of horizontal or vertical types, with one or several spindles.

Boring Mill—A lathe having its axis vertical, with table, and cross-rail carrying a tool-saddle.

Boring Rest—Used to steady and support either work or boring tools.

Box Tools—Cutters held in cast-iron boxes with steadies to ensure uniform results in turning.

Brass-finisher's Lathe—A type of lathe with a chasing rest, and usually a turret.

Breaking Piece—A pin or portion introduced into mechanisms, such as planers, to shear off when a dangerous strain accidentally comes on the driving gears.

Break Lathe—One with a wide gap, and an extra rest mounted on a pillar by the face plate, besides the rest and poppet on the bed.

Broaching—Smoothing out round holes with broach or reamer. In America the word means *drifting*, and broaching machines are employed.

Bush Grinder—A machine for lapping or grinding out bushes in hardened work, with a grinding wheel.

CABINET LEGS—Machine standards which are cast as cupboards for the reception of tools, etc.

Cam Cutting Machines—Either milling or grinding machines using formers.

Capstan Rest—A tool-rest carrying several tools in a circle. Also termed a *turret*.

Centring Machines—For drilling centre-holes in shaft-ends preparatory to turning or grinding.

Chamfering Machine—A type of lathe employed to chamfer or bevel nuts and bolt-heads.

Change-wheels—Toothed gears used to obtain speed ratios in screw-cutting, etc.

Chasing Lathe—One used for the production of screws by a die, or with tools traversed from a hob.

Chuck—Any appliance used for gripping work to be tooled.

Chucking Lathe—A face type of lathe employed for tooling objects held in a chuck by one end only.

Chucking Tools—Long drills and reamers used in *chucking lathes*.

Circular Milling Machine—A design in which wheels, etc., are rotated, and cut by milling cutters, instead of turning in the lathe.

Circular Motion—A fitting on a shaper which rotates to shape curved pieces.

Clamping Plates—Employed on most machine tools to hold work securely during tooling, or to grip the tools in their rests.

Clasp Nut—A divided nut which may be disengaged at will from a guide screw.

Cold-iron Saw—A circular saw, rotating at moderate speed (unlike the hot-iron saw), for sawing castings and forgings.

Collet—An intermediary fitting to hold cutters, drills, dies, etc., in spindles.

Combination Chuck—A lathe chuck, the jaws of which can be operated independently or simultaneously at will.

Combination Machines—Those which are capable of performing various operations, instead of only one, as boring, drilling, and milling, planing and grinding, planing and slotting.

Compound Rest—A slide-rest with superimposed slides, affording movements in two directions.

Concentric Chuck—One in which the jaws are moved simultaneously. It is also termed *self-centring*.

Cone-plate—A form of steady-rest, comprising a disc bored with differently-sized taper-holes and mounted on a bearing-pin. It is set upright facing the lathe-head, and one taper-hole receives the end of a piece of work, which is then drilled.

Countershaft—An intermediate shaft with belt pulleys by which speed changes are obtained, and machines started and stopped.

Cut-off Rest—A transverse rest used in capstan lathes to part off work.

Cutters—May be turning tools held in a bar, boring tools, facing tools, or milling cutters.

Cutting-off Machine—A type evolved from the lathe. It has a hollow spindle and a cross-slide, parting off shafts and bars with perfect accuracy.

Crankshaft Lathe—This is a massive form, with a number of slide-rests.

Cylinder-boring Machine—Either of horizontal or vertical design, the latter being preferred for very large bores.

DEAD CENTRES—Those which do not revolve, as opposed to live centres.

Diamond Tools—Diamonds are employed to true up grinding wheels of emery, corundum, carborundum, etc.

Die—A screw-cutting appliance used in machines.

Die-head—One which holds several chasers radially, these being removable for sharpening, and may sometimes release or move outwards to clear the thread after cutting it.

Disc Grinders—Machines employing discs of steel upon which sheets of abrasive cloth are cemented. Very accurate results may be obtained in this manner.

Dividing Head—A fitting which has provision for locking a spindle in a number of positions, representing divisions of the circle; used for tooling polygonal objects and for cutting gears on the milling machine. Also termed *index centres*.

Division Plate—A disc fitted to a lathe-head, or a dividing head. It has several circles of holes to effect divisions around a circle.

Dog Chuck—A chuck with jaws moving in slots.

Double—This prefix is placed before many types of machines having double heads or spindles, etc., or possessing double-acting mechanism to increase output.

Drifting—Finishing out holes of square or other shape with a drift, having serrations, or teeth, forced through the holes by power.

Drill—A tool which originates holes; flat, fluted, and twist-drills are the principal.

Drill Chuck—A small chuck with long jaws operated concentrically.

Drilling Machines—May be of vertical or horizontal designs, with one or more spindles, provision for angling, hand or power feeds.

Duplex—This is a term applied to machines when portions are duplicated, as duplex rests.

EDGE MILL—A milling cutter that acts by teeth on its sides. Called also a *side mill*.

Elliptic Chuck—A special lathe chuck possessing a sliding portion, by which elliptical objects are turned or bored. Erroneously called *oval chuck*.

End Mill—A milling cutter operating by its end teeth, as distinct from an *edge mill*.

Ending Machine—The same as a *rotary planer*; employed for trimming the ends of large girders and columns, etc.

Engine Lathe—One of complete type, for sliding, surfacing, and screw-cutting.

FACE LATHE—One that has no poppet, work being held on the plate or chuck only.

Face Mill—An *end mill*, but of large diameter.

Face Plate—The disc screwed on the lathe spindle nose, and slotted to receive holding-down bolts.

Facing Arm—This is an attachment to a boring bar, by which the end portions of bored work are faced across.

Feed Mechanisms—Devices employed to feed slides or spindles at definite rates. Belt-cones or gears or friction wheels are used to effect the necessary changes.

Fixture—An appliance for setting and holding a piece of work on a machine in a definite position, which may be repeated exactly for other similar pieces. *Jig* is another name. Some, as for drilling, have guide bushes to control the position of the drills.

Flexible Shaft—Used in connection with portable machine tools, driving them in any position by the flexibility of the shaft, which is produced by coiled wires or a number of joints.

Floor Plate—A large tee-slotted plate on which massive work is laid and tooled by portable machines shifted about, and bolted anywhere on the plate.

Forge Lathe—A massive lathe employed for turning forged work, as shafts, etc.

Forming—Turning irregularly-shaped pieces with tools of the same profile.

Frame-plate Slotting Machine—This is a special type for locomotive work, having several slotting heads above a long table on which a pile of frame-plates are laid.

Friction-clutch—Employed extensively in machine-tool work, both for countershafts and in machine construction, for throwing movements in and out quickly.

GANG—Applied to a set of tools, such as gang mills, which are built up of several separate cutters.

Gap Lathe—A lathe with a break in the bed to receive large objects.

Gear-cutting Machines—These employ either rotary cutters or reciprocating planer tools. Teeth are pitched out with dividing wheels, or worm wheels. Machines are semi or entirely automatic. Teeth derive their shape from the cutters, or from formers or templets, or are generated by the mechanism embodied in the machine.

Grinding Machines—Those employing rotating wheels, and used for finishing plane surfaces, curves, holes, and cylindrical portions. Either the work or the wheel may move, or both.

Grinding Wheels—Wheels of emery, corundum, carborundum, or alundum, used in grinding machines.

Gun Lathe—A very heavy type for turning and boring guns. Steady rests are employed to support the great weight.

HACK-SAW MACHINE—A reciprocating type, carrying an ordinary blade; it has a vice to hold work.

Hand—Applied to hand-operated mechanisms, as hand-drill, hand-feed, hand-lathe (one with plain slide-rest).

Headstock—The driving head of a lathe or grinder. Also called the *live head, fixed poppet head, or fast headstock.*

High-Speed—Relates to the abnormal speeds possible by the use of high-speed steels. Lathes and other machines are much modified in driving and feeding details and strength of parts.

Hob—A short screw which guides the nut in a chasing lathe. Also a cutter for producing worm-wheels. A master tap over which screwing dies are cut.

Hobbing—Cutting worm and spur gear teeth by a rotating hob, the gear blank rotating continuously.

Hollow Drill—Made so in order to pump oil through to the cutting point and wash out the chips.

Hollow Mill—A hollow cutter which passes over a bar and reduces its diameter; usually held in a turret.

Hollow-spindle Lathe—One with a hole bored right through the spindle, to pass bars, which are turned and cut off. Spring chucks are placed on the nose.

Horizontal—A prefix used in connection with drilling, boring, and milling machines which have their spindles lying horizontally.

INDEPENDENT CHUCK—A chuck, the jaws of which can be moved independently of each other.

Indicator—An instrument which magnifies error in machine movements and enables delicate tests to be made.

KEYSEATER, or KEYWAY CUTTING MACHINE—An adaptation of the slotting machine, for cutting keyways in wheel-bores. It has a reciprocating tool.

LAPPING MACHINE—A kind of lathe which revolves a lap, charged with abrasive powder; used for truing out holes.

Lathe—A machine which rotates work upon a plate or chuck, or between two centres, and cuts with turning tools.

Lead Screw or Leading or Guide Screw—The master screw of a lathe, by which threads of various pitches are produced.

Line Shafting—The main shafting driven by the prime mover, and from which countershafts are belted.

MACHINE VICE—A vice with movable jaw, to hold pieces of work for tooling.

Magazine Feed—A mechanism which feeds separate pieces of work into a machine, instead of employing an attendant.

Mandrel—The spindle of a lathe-head. Also a separate spindle on which work is held for tooling. A mandrel press is used for forcing work on and off.

Milling Machine—One which employs rotary many-toothed cutters.

Multiple-spindle Drilling Machine—One with several spindles to drill a number of holes simultaneously.

NEST GEAR—A set of toothed gears mounted in such a manner that changes of speed can be obtained by different combinations.

Nut Lathe—Used for facing and chamfering nuts, held on a mandrel.

Nut-tapping Machine—A machine using long taps, which pass through the nuts until a string of them is done.

OIL—Used for lubricating machine parts and cutting tools.

Open and Crossed Belts—A means of reversing the motion of a pulley.

Open-side Planer—A planer in which one standard is omitted, leaving space for large work to project over the table.

Open-spindle Lathe—A *hollow-spindle* type, with a large slot into which the operator's hand reaches.

PIT PLANER—A large style of planer, in which the housings and rail travel over work supported in a pit.

Planing Machine—A reciprocating type of machine, in which the work usually travels on a massive table under the tools; sometimes the tools move.

Poppet—The loose headstock of a lathe or grinder. Called also the *tailstock, footstock,* or *sliding head.*

Profiling Machine—A milling machine, the cutter slide of which is controlled by a form resembling the work outline.

Pump—Used for supplying oil or suds under pressure to cutting tools.

QUARTERING MACHINE—Employed for drilling the crank-pin holes at right angles in locomotive wheels after they are pressed on their axles.

Quick Return—The rapid backward motion of slides during the non-cutting stroke.

RADIAL DRILL—A drilling machine having a pivoted arm, enabling the drill to be moved about over the work.

Reamer—A fluted tool used to finish drilled holes.

Rotary Planer—A form of milling machine using a large face cutter with inserted teeth.

SADDLE—A sliding portion which carries other slides or rests.

Screwing Machine—Either a bolt-screwing machine or a pipe-threader.

Screw Machine—A type distinct from the above. It possesses turret and rest, and turns and cuts off the work.

Screw-milling Machine—A recent development by which screws are milled instead of being turned.

Sensitive Drill—A small type, the spindle of which is fed by hand lever.

Shaping Machine—A machine in which the tool is carried in a reciprocating ram passing over the work-table.

Side Planer—Resembles a shaper, but the head travels along the bed, taking a long cut on the end of work too big to go in the ordinary planer.

Slot-drilling Machine—Used for cutting keyways and cottar-holes by a revolving cutter, endlong motion producing a slot.

Slotting Machine—A vertical ram machine with horizontal table.

TAPPING MACHINE—This operates taps for nuts, etc. A sensitive device obviates breakages.

Tool Grinders—Include those for lathe and planer tools, cutter grinders, and drill grinders.

T-slot or Tee-slot—This special shape is employed to enable bolts to be slid into any position for clamping work on tables.

Tyre Lathe—Used for boring and turning railway wheel tyres.

UNIVERSAL—Used in connection with certain machines which embody very complete movements, as universal millers, universal grinders, distinguishing them from simple or "plain" machines.

Universal Joint—A pivoted joint employed to transmit motion to portions which are not stationary.

VALVE CHUCK—A lathe chuck having jaws by which a several-faced object may be turned successively into several positions for tooling.

Vertical—Applies to the position of spindles or rams, as in vertical drills and boring machines, vertical lathes or boring mills.

WALL—Used to denote wall-drilling machines, wall planers, etc., which are not self-sustaining.

Wheel Lathe—A special kind used in locomotive shops for boring and turning wheels.

MOTOR ENGINEERING

SEE ALSO PRIME MOVERS AND TRANSIT

ACCELERATOR—A pedal acting on the throttle which controls the supply of gas to the engine.

Accidents—May arise from many causes, a car being a complicated mass of mechanism. A chauffeur must be qualified to deal with all emergencies on the road. See specific headings.

Accumulator—Two accumulators provide a storage of electricity on a motor-car. They have a voltage of about four—a little above or below.

Ackermann Axle—One having pivoted arms.

Advance Spark—Timing the ignition so that the explosion is generated before the piston quite reaches the top of its stroke.

Air-cooled Cylinder—The cylinders of motor cycles and some light cars are air-cooled.

Automatic Valve—An inlet valve which is moved inward by the explosive mixture, in opposition to a partial vacuum produced in the cylinder on the outstroke. The term is used to distinguish it from a valve which is operated by mechanical means.

BACK-FIRE—An explosion which, happening at the wrong time, tends to run the engine in the way opposite to its proper direction.

Balance—The throws of a crank shaft are counterbalanced to prevent injurious vibrations.

Brake—Two kinds of brakes are used on cars—the band and the expanding type. One brake acts on the gear shaft, and one each on the driving wheels. The engine is also used as a brake on steep hills.

Burst Tyres—May be mended temporarily by lacing a gaiter on.

CAM—A projection which is eccentric in relation to the axis of the cam shaft.

Cam Shaft—The half-speed shaft which carries the cams for mechanically operated valves. The cams are formed solidly with the shaft.

Carburetter—The apparatus in which air for combustion, sucked in with the piston, draws with it a spray of petrol. Termed a carburetter because the air is carbonised.

Cardan Shaft—The second or universal shaft, driven by change-speed gears, which drives the back axle.

Changing Gears—Gears must only be changed when the engine is not driving the car. It must be disconnected from the gear by the friction clutch operated by a pedal.

Change-speed Gears—The fixed and sliding series of gears by which the speeds of a car are changed though the engine may run at normal speed.

Change-speed Lever—The lever in the right hand of the driver, which is locked in notches in the quadrant, for the three forward speeds, a neutral or out of gear position, and the reverse.

Chassis—A car with its engine and machinery ready for the body work of the coachbuilder.

Chauffeur (Fr.)—Literally, a stoker or fireman.

Clutch—In a car it forms the connection between the crank shaft of the engine and the gears which drive to the rear axle.

Coil—The current from the accumulator passes through a coil to produce the high tension spark for ignition, passing round the primary and the secondary or high tension wire.

Commutator—A term often applied to the contact-breaker.

Compression—Produced by the in-stroke of the piston, and necessary to yield a powerful explosion.

Compression Cock—Used to release compression when the engine is being turned round by hand for cleaning. Also for injecting paraffin oil to make a stiff piston move easily.

Compression Stroke—The instroke of a piston which compresses the explosive mixture. This may be about equal to 80 lb. per square inch.

Contact Breaker—The apparatus by which electric contact is made and broken between the coil and the engine. Its drum can be adjusted to make contact early or late.

Cooling Water—Only soft water should be used; hard will cause a deposit and check the circulation.

Crank Case—The casing under the engine containing the crank shaft. It is usually an oil reservoir.

Crank Pin—That portion of the throw of the crank which is embraced by the big end of the connecting rod.

Crank Shaft—The main shaft which receives its motion from the connecting rods and pistons.

Cylinder Deposit—A carbonaceous deposit which is liable to accumulate from the petrol and lubricating oil. It must be scraped out.

DEFLATION—The escape of air from a tyre. May be caused by puncture, or is done when a tyre has to be removed.

Densimeter—See Hydrometer.

Differential Gear—Equal bevel wheels connected by bevel pinions, without shafts, and rotated in a case, so that the wheels may rotate faster or slower when going round corners.

Direct Drive—Signifies driving done at the highest speed without going through gear wheels.

Drop Feed Lubrication—Feeding oil by gravity through tubes distributed to the bearings. Also termed sight-feed lubrication.

ENGINE BRAKING—Using the resistance of the movements of the engine to check the movement of a car.

Engine Stopping—This may be caused by choking of the carburetter, or by short circuiting, or a faulty coil, or a broken connection, or the pistons may seize.

Exhaust Stroke—The instroke of a piston which ejects the burnt gases from a cylinder.

Exhaust Valve—The valve in the head of a cylinder through which the burnt gas escapes into the air.

Explosive Stroke—The outstroke of a piston which is produced by the explosion of the mixture of vapour and air behind it.

FAN—The cooling of the water in the radiator is assisted by a fan revolved behind the radiator, and driven by the crank shaft. Frequently the fan blades are formed in the fly-wheel.

Fierce—The equivalent of seizing as applied to a clutch.

Firing—Exploding the charge in a cylinder. It takes place rather before the piston reaches the end of its compression stroke.

Float Chamber—One of the chambers in a carburetter in which a float maintains the petrol at a uniform level.

Flooding—A carburetter is flooded when the petrol runs over. Also signifies admitting petrol in excess for the purpose of starting the engine.

Fly-wheel—Is carried by the crank shaft and receives the transmission clutch.

Forced Lubrication—Is effected by a valveless pump which supplies oil under pressure to the bearings of the engine parts, etc.

Four-cycle—Inspiration of the gas, followed by compression, explosion, and exhaust.

Freezing—Frost is liable to crack motor cylinders if water is left in them, and to prevent circulation in the radiator.

French Chalk—Used to prevent the inner tyre tube from sticking to the covering tube.

GATE CHANGE—The alternative of the notched quadrant method of changing speed gears. The lever moves through slotted gates, so that the gears cannot miss.

Gear Box—The case which contains the change-speed gears, and the lubricant in which they run.

Gear Teeth Stripping—The tearing off of portions of teeth consequent on wear, or on throwing them in without disconnecting the engine shaft from the driving axle.

Gills—The ribs cast on the cylinders of motor cycles to increase the air-cooling surface.

Governor Control—The movements of the throttle valve regulated by the revolving weights of the governor, controlled by driver's hand or foot.

Gravity Feed—System of running petrol from a tank placed above the carburetter.

Gudgeon Pin—The pin which unites the small end of the connecting rod to the piston, and around which the rod pivots.

HALF-TIME SHAFT—The cam shaft which lifts exhaust valves. So called because it runs at half the speed of the crank shaft, from which it is driven by toothed gears.

Hand Starting—Starting an engine by turning a lever to introduce the explosive mixture and compress it, without which ignition cannot occur.

High Tension Current—The current coming from the secondary coil which gives the spark necessary for igniting the explosive mixture in a cylinder.

Hydrometer or Densimeter—A glass tube weighted at its lower end, and marked for different specific gravities, water being 1. It is used to test the sp. gr. of petrol or other oils.

IGNITION—The electrical means adopted for firing the charge in the cylinder head.

Inlet Pipe—The pipe conveying the gas from carburetter to inlet valve.

Inlet Valve—The valve in the head of a cylinder through which the petrol vapour and air are sucked in.

Instroke—The movement of a piston towards the cylinder head from the direction of the crank shaft.

Insulation—Is absolutely necessary in conducting the high tension current from the induction coil to the sparking plug. Insulation is of thick rubber, and enclosed in a tube of brass or vulcanite.

KNOCKING—Is produced by want of alignment in the crank shaft, so that the shaft does not lie at right angles with the piston rods. The remedy is to pack up the lower bearing. There are other causes, as loose bearings, or deposit on the top of the piston.

LIGHT OIL—An oil which has a specific gravity much below that of fresh water. Thus, petrol has a sp. gr. of 0·70 to 0·72, water being 1. If greater than 0·730, it is not suitable.

Live Axle—One which rotates with its wheels, as distinguished from a dead axle, which is fixed, and on the ends of which the wheels revolve.

MAGNETO—A small electrical machine frequently preferred for ignition to the accumulators and coil. It includes armature, pole-pieces, condenser, and connections.

Magneto Drive—This is effected from the engine by the half-time shaft.

Mechanically Opened Valve—An inlet valve which is opened by a cam and levers, as distinguished from an automatic valve.

Miss-fire—Occurs when the sparking plug does not work owing to short-circuiting.

Miss-gear—Signifies the failure to get gears into mesh.

Mushroom Valve—The lifting type of exhaust valve, comprising a disc fitting on its seating and a stem surrounded with a spring and actuated by the cam on the half-time shaft.

NEEDLE VALVE—A slender valve which shuts off the supply of petrol to the float chamber of a carburetter, and which is controlled by the vertical movements of the float.

Negative Plates—These in an accumulator become, with use, of a grey tint.

OIL PUMP—This is either a hand pump or one worked from the engine to lubricate bearings.

Otto Cycle—Comprises two outstrokes and one instroke for each explosion, namely: (1) sucking in explosive mixture; (2) compressing; (3) firing; (4) exhausting.

Outstroke—The movement of a piston away from the cylinder head in the direction of the crank shaft.

Overheated Cylinders—May be due to an insufficient supply of water in the circulating system, or a radiator having too small a surface, or to a lack of air supply to the petrol, or too little cylinder lubrication, or to a delay in the ignition, each requiring its own remedy.

Overheating of Parts—Is due to many causes. See specific headings.

PETROL—The lighter first distillations from petroleum, or rock oil.

Petrol Taking Fire—This cannot be extinguished with water, but with sand or a chemical extinguisher.

Petrol Tank—Must not be filled near a lamp, or the vapour will ignite.

Platinum—The contacts of contact-breakers are tipped with platinum to prolong the wear.

Pneumatic Tyre—Comprises the inner tube, which is inflated, and the outer cover, which receives the pressure.

Positive Plates—These in an accumulator become, with use, of a reddish-brown colour.

Punctured Tyre—Is mended with a patch of indiarubber and rubber solution, the surface surrounding the puncture being first cleaned with glass-paper.

RADIATOR—The series of piping and grills in front of a car through which the hot water from the cylinder circulates and is cooled by the air.

Radius Rods—Rods which are attached to a cross-piece on the car body at one end, and to the top and bottom of the bevel gear case of the back axle at the other. They check the tendency of the gear case to turn round the axle.

Ratchet and Pawl—Fitted to a gear brake drum to prevent a car from running backwards.

Reverse Gear—The intermeshing of three gear wheels in the gear box so that the forward motion of the engine is converted into a backward motion at the road-wheels.

SCROLL IRONS—The irons attached to the frame of a car which receive the links that carry the ends of the springs.

Second Shaft—The one which is driven by the change speed gears, and drives the back axle, to distinguish it from the first or engine shaft.

Security Bolts—Bolts with flat heads which hold the covering tyres in place in the central position, so reinforcing the grip of the beaded rims.

Seize, Seizing—The tearing up of the particles of metal between surfaces in contact, caused by their too intimate intermixture.

Self-firing—Ignition in a cylinder produced by the heat caused by the presence of cylinder deposit, and which occurs without the spark.

Side-slip—Is caused chiefly by greasy roads, by the camber of the road being too high, or by turning corners too quickly.

Silencer—The box through which the exhaust gases pass to the atmosphere, and in which they are expanded before being discharged.

Spares—Duplicates of the small, more vital parts of a car which are carried to enable temporary repairs to be made on the road.

Sparking Gap—The space between the end of the high tension wire and the sheath of a sparking plug. It measures about one-sixteenth of an inch.

Sparking Plug—Conveys high tension current to the inside of the cylinder to fire the explosive mixture. The plug itself is a non-conductor of porcelain contained in a sheath of metal screwed into the cylinder.

Splash Lubrication—Signifies the lubrication of crank and engine parts with oil contained in the crank case, which is splashed up by the revolutions of the crank within it.

Sprag Wheel—A ratchet wheel.

Spray Carburetter — Specifically, the present type in which the petrol is sprayed, to distinguish it from an old form of surface carburetter in which petrol was absorbed by air passing over its surface.

Spray Chamber—One of the chambers in a carburetter up which the petrol is drawn through a nozzle from the float chamber by the induction of the air.

Spring Ring—A piston ring is thicker on the side opposite the split, to increase its elasticity.

Sprocket Drive—Used when each road wheel on the back axle is driven separately from a shaft driven by differential gear in the gear-box.

Steel Tyre—The flat rim of steel attached permanently to the wooden felloe of a wheel.

Steering Gear—The mechanism by which the movements of the front wheels of a car are controlled. By the turning of the hand-wheel, a worm moves the worm-wheel segment, and thence levers actuate the wheels.

Steering Pillar—The inclined pillar in front of the car driver which carries the steering shaft, its hand-wheel at the top, and worm at the bottom.

Steering Wheels—The front wheels of a car, which are pivoted to the ends of the front axle.

Stub Axles—The short axles hinged to the front axle which carry the bearings on which the wheels revolve.

Studded Tyre—One which is provided with studs to prevent side-slip.

Suction Stroke—The outstroke of a piston which sucks the explosive mixture into a cylinder.

TACKY—Relates specifically to the sticky condition of the rubber solution, consequent on evaporation, with which a patch is cemented on a punctured tyre. When the solution has become tacky, the patch and tyre are pressed together.

Thick Oil—The oil used for the lubrication of engine parts.

Throttle Valve—A disc valve in the pipe leading from the carburetter to the engine. By regulating its movements the explosive mixture is admitted to, shut off from, or partly controlled to the engine.

Timing—The spark is retarded when starting an engine, and accelerated when running with speed.

Timing Ignition—In the mechanically operated valves this is done by setting the valves and the camshaft pinions. The inlet valve is set to begin to open when the piston is at the top end of the cylinder, and the exhaust valve to be shut when the inlet valve begins to open.

Torque Rod—A hinged member designed to resist any independent circular movement of the hind axle.

Transmission Clutch—The clutch by which connection is made and broken between the engine shaft and the change-speed gears.

Trembler Coil—An induction coil which is provided with mechanism by which it is rapidly interrupted, so that the contact is made and broken, and the sparking produced very quickly.

Tyre Bead—The thickened edges of the outer or covering tyre which are forced into the flanges of the steel rim.

Tyre Pressure—The pressure for inflation varies from 60 to 80 pounds per square inch in smaller and larger cars.

UNIVERSAL SHAFT—The second shaft driven by the change-speed gears, which has a universal joint at each end to permit it to accommodate itself to the movements of the back axle.

VALVE LIFTERS — Rocking levers which make roller contact between cams and valve spindles. They avoid side pressure, which occurs when cams and tappet rods are in contact. Also denote tools used for valve lifting.

Valves Breaking—If the head of a broken valve gets into the cylinder it must be got out with a piece of wire or a magnet, or it will fracture piston or cylinder.

Valves Leaking—This is remedied by re-grinding them on their seatings.

Vee-pulleys—The grooved pulleys on a motor cycle round which the driving belt passes.

Vulcanising—Uniting rubber patches, etc., with the aid of heat.

WATER—Is circulated through the cylinder jackets. If it becomes overheated, the efficiency of the engine is lessened.

Water-jacket—A narrow space enclosing the cylinder walls around which cooling water is circulated by a centrifugal pump drawing from a tank and driven by the engine.

MINING

SEE ALSO GEOLOGY, CIVIL ENGINEERING, AND BUILDING

ADIT—A gallery driven from the open-air into a mine; more particularly the gallery that drains a mine.
After-damp—The atmosphere produced by an explosion of gas in a mine. It consists of carbonic acid, nitrogen, and steam, with a small amount of the highly poisonous carbonic oxide.
Air-box—Wooden tubes for conveying fresh air to workings.
Air-courses—Passages for ventilation.
Air-crossings—Bridged passages for carrying one air-course across another.
Air-doors—Doors for regulating air-currents.
Air-pipes—Pipes for conveying fresh air to workings.
Alloy—A combination of two or more metals.
Alluvial Deposits—Deposits consisting of matter transported by water from higher ground.
Amalgam—An alloy containing mercury.
Amalgamation—The process of the formation of an amalgam; more particularly the use of mercury in the extraction of gold.
Amorphous—Without crystalline form.
Anemometers—Instruments for measuring velocity of air-currents.
Anhydrous—Free from water.
Arenaceous—Containing sand, or sandy.
Argentiferous—Containing silver.
Argillaceous—Containing clay, or clayey.
Assaying—Determining the amount of one or more specified constituents in mining produce.
Attle—Waste rock.
Auriferous—Containing gold.

BACKING DEALS—Planks placed vertically behind the curbs in a shaft to hold back loose fragments
Backs—The unworked portion of a vein above a level.
Bank—The surface land surrounding the mouth of a shaft.
Banket—Auriferous conglomerate consisting of quartz pebbles in a siliceous matrix.
Banksman—The man who receives the tubs at the top of the shaft.
Bar—See *crowntree*.
Basset Edge—Outcrop.
Battea—A very shallow slightly conical dish used for washing gold-dirt.
Bed—A stratified deposit [see *seam*].
Bed-rock—The rock upon which an alluvial deposit rests.
Bind—Shaley layers interstratified with coal-seams.
Bit—The chisel tip of a drill or the drill itself.
Black-band—An earthy carbonate of iron containing bituminous matter.
Black-damp—Carbonic acid gas, CO_2; *choke-damp*.
Blackjack—Zinc blende.
Black Tin—Dressed tin ore.
Blasting—Breaking away rock by means of an explosive.
Blende—Zinc sulphide.
Blower—A sudden emission of fire-damp in a mine.
Blue John—Fluor spar.
Bonanza—An exceptionally rich and persistent body of ore.
Bonnet—Covering to a cage to protect men from falling stones, etc.
Bord—A road driven in a seam at right angles to the main cleavage planes.
Bord and Pillar—See *pillar and stall*.
Bordways Course—The direction at right angles to the main cleavage planes. Also *on face*.
Bort—Opaque dark diamond.
Brattice—A temporary partition for purposes of ventilation.
Bucking—Crushing ore with the bucking iron.
Bucking Iron—A flat piece of iron with a wooden handle, used for crushing samples of ore.
Bunch—A small body of rich ore.
Bunchy Veins—Veins in which bunches occur.
Buntons—Timbers placed horizontally across a shaft.
Burrow—A heap; dump, or spoil heap.

CAGES—The conveyances consisting of platforms with framework used for transporting men, mineral, and material up and down a shaft.
Cap—A piece of wood placed on a prop in timbering. Also called *lid*. In metal mining, *bars* are called *caps*.
Caunter Vein—A mineralised cross-course.
Chimney—A continuous body of ore of moderate width but prolonged in depth.
Chocks—Stacks of pieces of timber laid horizontally with the alternate layers at right angles; also *cribs* or *cogs*.
Choke-damp—Carbonic acid gas, CO_2; black-damp.
Cleat—The more prominent cleavage in a coal-seam.
Cleavage—Planes of weakness in minerals and rocks along which they break up with comparative facility.
Cobbing—Removing adhering ore from pieces of veinrock with a hammer.
Cogs—*Chocks*.
Contact Vein—A vein lying between rocks of different character.
Conveyor—A running belt—very often used for removing coal from the face to the main haulage road.
Corves—The small waggons or cars used for the conveyance of minerals, etc., in mines; also called *trams* or *tubs*.
Costeaning—Seeking deposits by sinking shallow pits and connecting them by an underground gallery.
Country—The rock or rocks in which a vein occurs; also called country rock.
Course—See *strike*.
Cradle—A wooden box with sieve mounted on rockers, used to wash gold-dirt.
Creep—The forcing up of the floor by the pressure of surrounding beds in mine roads and workings.
Crib—Framing timbers in a shaft; also a *curb* or a *chock*.
Cropping out—The appearance of a vein or bed at the surface.
Cross-course—A barren vein having a different direction to the main veins of a district; similar to a fault.
Cross-cut—A gallery driven in the country.
Crowntree—A piece of timber set on props to support the roof; sometimes called *bar* or *cap*.
Curbs—Frames employed as foundations for walling or tubbing in a shaft.

DEAD GROUND—Parts of veins without ore or deficient in ore.
Deadwork—Unproductive work.
Deads—Waste rock; *attle*.
Deputy—Man in charge of a district in a mine.
Development—Operations conducted to render the useful minerals in deposits accessible.
Dial—A pattern of compass used underground.
Dialling—Surveying a mine by means of a dial.
Die—See *stamps*.
Dip—The deviation of the slope of a bed or vein from the horizontal.
Dipping Needle—A magnetised needle swinging in a vertical plane.
Dog and Chain—A device for a withdrawal of timber (props).
Downcast—The shaft through which the downward current of air passes into a mine.
Downthrow—The downward displacement of a seam by a fault.
Dressing—Separating ores from accompanying rock and minerals.
Drift—Any passage underground that is horizontal or nearly so.
Driving—Excavating drifts.
Dropper—A small branch vein on the footwall side.
Dumb-fault—A *wash-out*.
Dump—A waste heap; spoil heap.
Dyke—A vein of igneous rock.

EXPLOITATION—The productive work in a mine.

FACE—The exposed surface of mineral in a working.
Fault—The dislocation of a vein or seam. [See GEOLOGY.]
Feeder—A small branch vein.
Fiery—Containing explosive gas in dangerous proportions.
Fire-damp—Methane or marsh gas, CH_4.
Float Gold—Very finely divided or flaky gold, which floats on water.
Flookan or Flucan—A cross vein filled with clayey matter.
Floor—The stratum immediately below a seam or bed.
Flume—An artificial water-course.
Foot-wall—The under-wall of a vein.
Frame—An inclined wooden slab used in dressing tin ore.

GAD—A pointed wedge.
Gallery—A drift.
Gangue—The worthless portion of the contents of a vein; called also *veinstuff*, *veinrock*, or *matrix*.
Gate—A road kept open in the worked-out part of a mine; called also *gate-road*, or *gateway*.
Gin—A primitive form of winding engine; a whim.
Goaf—The worked-out ground of a coal-mine.
Gob—Same as *goaf*.
Gob-stink—A peculiar smell observed in a pit where spontaneous combustion is taking place; a mixture of higher hydrocarbon.
Gold-dirt—Earthy material containing particles of gold.
Gold-washing—Separating the particles of gold from the dirt by washing with water.
Gossan—The cellular and deeply stained material found at the top of some veins.
Grass—The surface of a metal mine.
Grizzley—A grating.

HADE—The deviation of the slope of a vein or seam from the vertical.
Hanger-on—The man who runs the loaded tubs on to the cage.
Hanging-wall—The upper wall of a vein.
Head Race—Aqueduct for the supply of fresh water.
Heads—The enriched products of ore-dressing. Also see *stamps*.
Headways Course—A direction parallel to the main cleavage planes.
Heave—The lateral displacement of a vein by a fault.
Hewer—The miner who *holes* the coal.
Hitch—A small fault.
Holing—Making the horizontal cut in a seam, usually below it, or in the lower part of it, called *undercutting*.
Horse—A mass of country in a vein.
Hushing—Flushing the surface away with water to expose a hidden deposit.
Hydraulicing—Washing away a deposit into special channels called sluices, by powerful jets of water.

INBYE—Going from the shaft (underground).
Intake—The road along which the fresh air passes in a mine.

JENKIN—A road cut bordways course in a pillar of coal.
Joints—Natural divisions in masses of rock.
Jud—A working place driven in a pillar of coal.
Jigging—A process of ore-dressing and coal-washing in which sifting and water buoyancy act together.
Jumper—A weighted iron or steel bar with chisel end used for drilling holes in rocks by hand.

KIBBLE—A mining bucket.
Kindly—Applied to veinstuff and country; tender, soft, easy, promising-looking rock.
Kirving—Synonymous with *holing*.

LAGGING—Small timber driven behind the main timbering in shafts or drifts to prevent loose fragments falling through.
Launder—Water trough, also a *flume*.
Leader—A branch vein.
Leg—The upright timbers supporting the *cap* in vein-mining timbering.
Levels—Drifts driven along a vein.
Lid—See *cap*.
Lift—Any working place a few yards wide driven in a pillar of coal.
Lode—The profitable portion of a vein, frequently the vein itself.
Long Tom—A wooden sluice used in gold-washing.
Longwall—A method of working by which the mineral is removed in one continuous series of operations.

MAN-ENGINE—An appliance used for raising and lowering men in shafts.
Matrix—The material in which a useful mineral is embedded.
Metalliferous—Containing a metal or metals of the heavier type.
Middles—The intermediate products in ore-dressing operations.
Mineralised—Containing metalliferous minerals.
Mortar—See *stamp*.

NICKING—Making a vertical cut or groove in a face of coal.
Nip or Nip out—A sudden thinning of a seam or vein.

ON END—Headways course.
On Face—Bordways course.
Open-cast—Workings in the open air.
Ore—Mineral worked for the metal it contains.
Out-bye—Towards the shaft (underground).
Outcrop—The part of a deposit exposed at the surface.
Overburden—The surface material covering a deposit of useful mineral.
Overhand Stoping—A system of extracting ore from a vein by excavations made overhead.

PACK, OR PACK WALLS—Pillars of rough waste stone built to support the roof in mining.
Pan—A shallow dish used in washing gold.
Panels or Districts—Areas of a coal-seam isolated by means of barriers of untouched coal, to ensure more agreeable and safer conditions of working.
Panning—The operation of washing gold in a pan.
Parting—An inter-stratified layer of foreign material in a coal-seam.
Pass—A passage kept open for transmitting ore or rock to a level below.
Pay-dirt—The valuable portion of alluvial deposits.
Piling—Sinking shafts through loose ground by driving piles down, behind cribs or curbs.
Pillar—A block of mineral left to support the workings.
Pillar and Stall—A system of working in which the deposit is in the first working cut into blocks or pillars, which are subsequently removed in the second working; also known as *post and stall, bord and pillar, stoop and room*.
Pinch—A vein is said to pinch when it gets gradually thinner, and if it then disappears it is said to *pinch out*.
Pipe—Similar to a chimney, also the penetration of an upper bed into a lower one.
Pit—A shaft, also an open working in soft material.
Pitwork—The pumps and other appliances in the shaft.
Placer—An auriferous alluvial deposit.
Plat—An enlargement in a shaft.
Pocket—See *bunch*.
Pockety—See *bunchy*.
Post and Stall—See *pillar and stall*.
Pulp—In ore dressing, the product of the fine crushing of ore in the presence of water.
Punch-prop—A strut or distance-piece placed between the cribs in the temporary timbering of a shaft.
Putter—Trammer.
Pyritous—Containing pyrites.

QUARTZOSE—Consisting chiefly of quartz.

RAGGING—A heavier stage of spalling.
Raise, or Rise—A passage driven upwards in a mine.
Reef—A vein.
Riffles—Obstructions placed in the bottom of sluices, etc., to facilitate the deposition of gold, generally strips of wood.
Roof—The stratum immediately above a seam or bed.

SAFETY LAMP—A lamp in which dangerous contact between the external atmosphere and the flame is prevented by the use of wire gauze.
Sands—In ore dressing, the heavier products of hydraulic separators.
Seam—A tabular or sheet-like deposit forming one of a group of stratified rocks used in a more restricted sense than the term *bed*.
Set—A complete unit of framing in shaft or level timbering.
Shaft Pillar—A block of mineral left to support a shaft.
Shoading or Shoding—Tracing detached stones to the parent vein.
Shoe—See *stamp*.
Shoot—A continuous body of ore extending downwards; also a *pass*, or the lower end of a pass.
Sill—The bottom member or sole-piece of a set of timber in a level or drift.
Skip—A rectangular box, working in guides in the shaft, used for winding ore or rock, etc.
Skirting—A road driven alongside fallen stone.
Slide—A small fault or dislocation.
Slimes—In ore dressing, the lighter products of hydraulic separators.
Sludger—A cylinder with a valve at the bottom for removing crushed stuff from a bore hole.
Sluices—The large wooden troughs used as a channel for the stream of water and dirt in hydraulic mining.
Sole-piece—See *sill*.
Sollar—A platform in a shaft.
Spalling—Breaking down lumps of rock or ore with heavy hammers.
Spitzkasten — Inverted pyramidal boxes used in ore-dressing.
Spitzlutten—Double V-shaped troughs used in ore-dressing.
Sprags—Short props of timber.
Stamp—A weight used in comminuting ore, consisting of a *head* in which is fixed a replaceable *shoe* below and a *stem* above; the stem carries a *tappet* which is periodically engaged and released by a revolving *cam*, causing the stamp to rise and fall. The stamp works on a *die* in a narrow box called a *mortar*.
Stamping—The process of reduction by means of stamps.
Stanniferous—Containing tin.
Staple—An underground shaft or *winze*; also a small pit.
Stemming—Tamping.
Stockwork—A deposit consisting of a number of small veins or patches of ore near together.
Stoop and Room—See *pillar and stall*.
Stope—The place where the mineral is won in a vein mine.
Stopping—A wall built to stop the passage of air.
Stowing—Filling a place with waste.
Stratum—A bed or seam.
Strike—The direction a vein or bed takes across country.
Stringers or Strings—Thin branch veins.
Stringing Deals—Planks employed to hang curbs together in the temporary lining of a shaft.
Studdles—Timber struts or distance pieces used to keep the *sets* apart in shafts in vein mining.
Stulls—Timbers or platforms fixed in stopes for supporting waste rock.
Stythe—Carbonic acid gas.
Sump—The lowest part of the shaft; a drainage pit.
Sylvester—A very popular device for withdrawing timber from gob.

TAILINGS—The impoverished and discarded products of ore-dressing operations.
Tail Race—Channel for conveying away dirty water and tailings.
Tamping—The material used and the operation of filling up a bore hole in front of the charge of explosive.
Tappet—See *stamp*.
Thill—The floor of a mine.
Throw—The vertical displacement of a seam by a fault.
Timbering—Fixing timbers to keep excavations free from obstruction by falls of stone.
Tinstone—Ordinary tin ore.
Trammer—A man who does the tramming of mineral and works the tubs.
Trend—Strike.
Tributers—Miners who work for a percentage of the profits.
Trommel—A revolving screen.
Tubbing—A continuous water-tight lining of a shaft.
Tut work—Contract piece work.

UNDERCUTTING—Holing beneath or at the bottom of a seam.
Underhand Stoping—Working out a vein downwards; the reverse to overhand stoping.
Underlie—Synonymous with *hade*.
Unstratified Rocks—Rocks not occurring in regular beds or strata.
Upcast—The shaft for conveying the vitiated air out of a mine.
Upthrow—The upward displacement of a seam by a fault.

VANNING—Separating ore from veinstuff by washing on a shovel.
Veinstone—The worthless material in a vein.
Veinstuff—Same as *veinstone, gangue*, or *matrix*.

WALLS—The sides of a vein.
Wash-out—A portion of a seam that has been denuded, also called a *dumb fault*.
Whim—See *gin*.
Whip—A winding pulley.
White Damp—Steam, carbonic oxide, and carbonic acid gas.
Whits—Partly dressed tin ore.
Winding Engine—An engine used for drawing mineral, etc., up a shaft.
Winze—A shaft extending from level to level.
Working in the Broken—Removing or *robbing* the pillars in the pillar and stall method.
Working in the Whole—Forming pillars by roads driven at right angles to each other, in the pillar and stall method of working.

THE SELF-EDUCATOR AT A GLANCE

All the articles in the Self-Educator are briefly summarised in the following pages, under the groups, sub-groups, and sections to which they belong and in order of publication. This affords a brief general survey of the branches of knowledge and also gives an easy means of obtaining a general idea of the scope and nature of the articles. Sections of the groups are indicated by sub-headings in black. For particular subjects or items of information, reference should be made to the General Index, beginning on page 6223. A list of plates and frontispieces is given on page 6222.

GROUP 1—SUCCESS

	PAGE
The successful life	1
Civilisation wants a man	145
The man who uses knowledge	281
The equipment for success	417
The man who opens his eyes	545
Success in public life	673

Education through travel	6049

GROUP 3—ARTS & CRAFTS

	PAGE
The language of the emotions	13
Art in the mists of time	155
The art of ancient Egypt	295
The art of the East	427
3000 years of Greek art	559
The imitative art of Rome	687
Art in early Christian times	823
The forerunner of Gothic art	945
Gothic architecture	1077
The dawn of the Renaissance	1211
Art in the Renaissance period	1345
The great Italian masters	1481
The art of Northern Europe	1613
Art in Western Europe	1745
The landscape painters	1875
Art in modern times	2009
Drawing and the human form	2137
Elementary drawing	2269
Model drawing and geometry	2402
Object drawing and geometry	2533
Model drawing and geometry	2665
Object drawing and geometry	2799
Object drawing and geometry	2929
Light and shade	3057
Practical solid geometry	3169
Light and shade	3289
Practical solid geometry	3411
Shading mediums	3527
Geometrical design	3647
Brush drawing	3775
Elementary perspective	3893
Advanced perspective	4023
Shadows and reflections	4149
Composition and illustration	4271
Art schools and painting	4400
Miniatures and illumination	4529
Principles of design	4655
Commercial designing	4784
The art of the sculptor	4909
Modelling and bronze casting	5049
Architecture	5177
An architect's detail drawings	5313
The education of an architect	5433
Wood, ivory, and bone carving	5549
Art work in metal	5673
Film photography	5811
Dark-room photography	5933

GROUP 4—PHYSIOLOGY

The wonder of a human being	19
How we are made	159
Systems and organs of the body	301
The structure of the body	434
The machinery of digestion	567
How food becomes life	696
Circulation of the blood	827
The stream of life	951
The organs of respiration	1085
The skin and its uses	1217
The framework of the body	1352
The muscular system	1489
Motion and locomotion	1619
The nervous system	1750
The spinal cord and the brain	1879
The structure of the eye	2014
Hearing, taste, and smell	2141
The human voice	2275

Health

Health as energy	2409
Food and health	2542
The most reasonable diet	2672
Food and appetite	2807
Milk and bread	2939
The nutritive value of foods	3062
The economics of food	3172
The air and health	3292
Dampness and health	3416
Dust and germs	3532
How to breathe	3654
The value of fresh air	3777
Physical exercise	3902
The value of sleep	4029
Life force in the nerve-cell	4155
The hygiene of climate	4276
Clothing and housing	4406
Baths and bathing	4532
Childhood and youth	4657
Why we grow old	4789
Drugs and their uses	4918
Alcohol and health	5056
What to do in accidents	5186

GROUP 5—AGRICULTURE

The mother of industries	23
The soil and its cultivation	163
The value of manures	305
The farmer's best seeds	440
The plants of the farm	572
Clover, root, and forage crops	703
Cultivation of farm crops	833
Pastures, meadows, and hay	955
Harvesting the crops	1090
Machinery of the farm	1223
The ensilage system	1358
Electricity on the farm	1491
The management of horses	1623
British breeds of cattle	1755
Cattle rearing and management	1885
Sheep and sheep-breeding	2019
Pigs and pig-breeding	2147
Goat-rearing	2278
Diseases of live-stock	2413
Selling and feeding live-stock	2546
Stock foods for cattle	2676
Farm buildings and workers	2811
Dairy farming	2943
Milk and its products	3065
Buttermaking	3177
Principles of cheesemaking	3295
Practical poultry-breeding	3419
The art of breeding	3535
Pure breeds of poultry	3657
Rearing and feeding poultry	3781
Breeding for eggs and meat	3907
Turkeys, geese, and ducks	4033
Keeping a poultry farm	4159
The management of bees	4278
Farming in Canada	4409
Agriculture overseas	4535

Forestry

Forestry as an industry	4661
Growing trees for timber	4792
Forest protection	4921

Gardening

The growing of fruit	5060
Cultivation of fruit	5189
Pruning and harvesting	5319
Enemies of the fruit-grower	5439
Propagation of fruit-trees	5561
Vegetables and their cultivation	5687
The garden beautiful	5825
Favourite garden flowers	5941
Co-operation in agriculture	6054

GROUP 6—CHEMISTRY

Chemistry and civilisation	29
Makers of modern chemistry	168
How chemistry helps the world	309
The new triumph of chemistry	443
Where chemistry and physics meet	577
The new alchemist	709
The affinity of elements	839
What we know of the atom	960
The elements in detail	1094
More elements in detail	1228
Carbon and allied elements	1360
Oxygen and other gases	1496

	PAGE
The remaining elements	1629
The laws of compounds	1760
The great laws of chemistry	1890
Radium and the world	2023
Some inorganic compounds	2150
The reality of the atom	2281
The modern theory of matter	2418
The atom's wonderful secret	2551
Matter is electricity	2680
Organic chemistry	2815
The paraffins and alcohols	2949
The properties of alcohol	3069
The ethers and their uses	3181
Some products of alcohol	3301
The fatty acids	3422
Lactic and some toxic acids	3540
Acids, sugars, and benzene	3665
Chemicals in food	3786
The chemistry of drugs	3909

Applied Chemistry

Applied chemistry	4036
Laboratory apparatus	4162
Chemical analysis	4286
Commercial acids	4412
Alkalies and organic acids	4539
Oils, fats, waxes, candles	4665
Soap, glycerin, and essential oils	4797
Paints and polishes	4926
Glue, starch, and ink	5067
Chemical manufactures	5197
Artificial manures	5325
Water softening and use of waste	5451
Artificial silk	5567
Textile dyeing	5701
Artificial dyes	5837
Dyeing machinery	5958

GROUP 7—HISTORY

The first days of history	33
Egypt's greatest days	171
Rise of the Persian empire	313
The glory that was Greece	446
The era of Greek conquest	581
The lasting influence of Greece	712
The rise of the Roman state	843
The rise of the Cæsars	965
The grandeur that was Rome	1101
The spirit of ancient Rome	1233
The Middle Ages in the west	1367
Early Middle Ages in the east	1501
The ruins of empire—and chaos	1635
The heroic age of chivalry	1765
The crosier against the sword	1895
Passing of the age of chivalry	2027
The days of religious chaos	2155
The passing of the Middle Ages	2285
The rise of the Balkan States	2423
Poland, Russia, and the Turk	2557
The changing centuries	2685
Wars waged for religion	2821
Rise and decline of the Bourbons	2955
The New World and India	3075
The era of the Reformation	3187
The Roman counter-reformation	3307
The era of the Thirty Years' War	3425
The era of the Grand Monarch	3545
British freedom and expansion	3673
Eastern Europe and India	3793
The struggle for empire begins	3915
The losing and winning of empires	4043
The rise of Republican France	4165
The conqueror and his doom	4295
From Waterloo to the Crimea	4423
Europe since the Crimean War	4553
Progress of Anglo-Saxon rule	4677
Europe's debt to the past	4806
Continuity in civilisation	4936

GROUP 8—CIVIL ENGINEERING

The engineer's training	39
The surveyor's instruments	179
The methods of surveying	322
Methods of levelling	453
Operations in field surveying	589
Railway and mine surveys	717
Marine surveying	850
The Ordnance Survey	972
Parliamentary powers	1109
Varieties of construction	1239
Uses of reinforced concrete	1375
The contractor's machinery	1507
Road making and maintaining	1643
Methods of road draining	1772
New streets and footpaths	1903
The building of bridges	2035
The stability of walls	2161
The stability of arches	2294
Railway construction	2430
Railway earthworks	2563
Making the embankment	2690
The road of rails	2828
Track equipment	2961
Tramway construction	3079
Mountain railways	3192
Water supply	3311
The treatment of water	3130
Water storage and service	3551
Sewerage and sewage disposal	3678
Refuse destruction	3797
Control and use of moving water	3920
Foreshores, harbours, and docks	4047

Transit

The principles of vehicle design	4171
Motor-car bodies	4301
Commercial motor bodies	4427
Motor-cycle construction	4559
Materials for motor-cars	4682
Machining and erecting motor-cars	4811
The science of flying	4941
The British railway system	5078
Railway management	5208
The railway staff	5329
Railway signals and brakes	5459
Passenger traffic	5571
Merchandise traffic	5711
Minor railway departments	5844
The management of ships	5967

GROUP 9—LITERATURE

The imperishable glory of a book	44
The purpose of poetry	188
The rise of English poetry	331
The Elizabethan Age	457
The eve of Shakespeare	593
Shakespeare	721
Poetry of the Elizabethan Age	854
Poetry from Milton to Cowper	975
The drama since Shakespeare	1113
Nineteenth century poetry	1245
Tennyson and after	1383
The beginning of English prose	1511
The shaping of English prose	1649
Eighteenth century prose	1778
Eighteenth century prose	1911
Nineteenth century prose	2047
The modern era of prose	2166
More recent prose writers	2299
A study of English fiction	2435
The novel and its creators	2570
The Waverley Novels	2699
From Scott to Stevenson	2837
The novelists of today	2971
Comparative literature	3085

Journalism

Journalism—the ideal career	3107
First steps in journalism	3317
The reporter and his work	3436
The sub-editor	3559
The editor and his paper	3694
How to write	3802
The free-lance journalist	3934
The journalist's system	4062

Printing

The printing industry	4179
The work of the compositor	4313
Composing machines	4435
Imposing and locking up pages	4570
The book in the foundry	4689
The printing of books	4821
The jobbing printer	4958
A newspaper in the foundry	5083
Printing a newspaper	5214
Typefounding	5345
Photo-engraving	5478
Colour-printing	5585
Lithography	5723
The art of the engraver	5851
Bookbinding and publishing	5973

GROUP 10—CIVIL SERVICE

The civil army of the nation	49
Municipal careers	193
Municipal engineers and surveyors	337
Electrical and water engineers	461
Medical officers of health	597
Municipal posts and salaries	725
The town clerk	858
The municipal treasurer	980
Municipal clerkships	1116
Police and firemen	1251
Posts in the educational army	1387
Librarians and executive officers	1514
Poor Law doctors and nurses	1653
Poor Law appointments	1781
National service	1917
First-class clerkships	2053
Clerkships and minor posts	2171
The Post Office service	2302
Foreign Office careers	2438
Admiralty and Revenue posts	2573
Special home appointments	2703
Imperial service in the East	2842
State service in the Colonies	2976
Colonial municipal posts	3089
Banking	3200
The Bank of England	3320
Practical banking	3441
Foreign exchange	3564

Professions

The bank's bookkeeping	3697
Bank officials	3807
The law as a career	3939
Medicine as a profession	4068
The dentist and his assistant	4183
The practice of pharmacy	4317
The nurse and her duties	4438
The sick-room	4574
Insurance as a career	4692
The branches of insurance	4827
Auctioneering and valuing	4960
The Church as a career	5088, 5220
Scholastic careers	5349
The work of the secretary	5479
The public librarian	5587
The quantity surveyor	5732
The Royal Navy	5857
The naval officer	5979

GROUP 11—LIFE AND MIND

What we know about life	53
The wonder of the cell	199
A search for the simplest life	344
The architects of life	461
The origin of life on the earth	601
The sun's influence on life	729
How life may be beginning now	860
The structure of the cell	983
The nucleus of the cell	1121
The evolution of sex	1257
The living world surveyed	1391
The onward march of life	1517
Life is mind and mind is life	1657
The great work of Lamarck	1785
The vital impulse	1921
The work of Herbert Spencer	2056
Charles Darwin	2175
Mendel and his work	2307
Modern Mendelism	2441
The meaning of Mendel's law	2577
Achievements of Mendelism	2707
The limits of Mendelism	2845
Germ-cells and environment	2979
Some aspects of heredity	3092
The facts of human heredity	3205
The autonomy of life	3325
The adaptation of life	3445
The mind of man	3567
The instinct of man	3703
More clues to conduct	3811
National character	3943
The power of intellect	4072
The psychology of parenthood	4188
The uplifting of the race	4323
Good citizenship	4444
The care of public health	4580
Problems of citizenship	4699
The intelligence of animals	4833

GROUP 12—BUSINESS

The vital principles of business	58
The science of wealth	202
Foundations of good business	344
Education for business life	467
Essentials of business finance	606
The future of the home market	735

PAGE

Future of the export market .. 865
Why London rules business .. 988
Organisation of an office 1126
Business correspondence 1261
Office labour-saving devices .. 1396
Factory organisation 1521
Buying and costing 1661
The organisation of sales 1789
The successful salesman 1925
The card index in business .. 2059
The export trade 2179
The import trade 2311
Shipping goods abroad 2445
Finding new markets 2580
Trade-marks 2711
The formation of a company .. 2849
The secretary of a company .. 2983
The working of a company .. 3096
Commercial contracts 3209
Commercial law 3329
Factors of prosperity 3449

Shopkeeping

For particular shops, see Index

The chances of the small shop .. 3571
Beginning shopkeeping 3707
Law for the shopkeeper 3815
Buying, stocking, and selling .. 3947
The use of the shop window .. 4076
System in a retail shop 4191
Success in shopkeeping 4327

Advertising

The principles of advertising .. 5741
Catalogues and price lists 5862
Miscellaneous advertising 5983

GROUP 13—PHYSICS AND POWER

The science of everything 62
Matter, force, and energy 207
The laws of motion 349
The measurement of motion .. 471
What gravitation means 609
The universal ether 740
The physics of fluids 871
The properties of matter 992
The science of heat 1131
Heat of liquids and gases 1267
The physics of heat 1403
A study of sound 1527
How we hear 1667
A study of light 1795
Properties of light 1931
The properties of lenses 2065
Has sight reached its limit? .. 2185
The wave lengths of light 2317
Light rays and light pressure .. 2452
The mystery of colour 2587
Phenomena of a ray of light .. 2717
The wonderful Röntgen rays .. 2857
The mystery of magnetism .. 2989
Crystallisation and solution .. 3103
The nature of solution 3213
The mother of sciences 3333
Power and its sources 3455
The search for cheap power .. 3575
Harnessing power 3713
The steam-engine 3819
Engine cylinders and valves .. 3952
Types of steam-engines 4081
Steam-engine construction .. 4194
Three-cylinder engines 4331
Link motions of valves 4456
Marine and Corliss engines 4592
The modern locomotive 4711
Steam-turbines 4851
Gas, oil, and petrol engines .. 4974
Steam-boilers 5102

GROUP 14—BUILDING TRADES

Past and future of building .. 69
Strength and use of timbers .. 211
Natural and artificial stones .. 353
Strength and testing of materials 477
Strength of building stones .. 614
First essentials in building 744
Laying the foundations 876
Drainage applied to building .. 999
The practice of drain-laying .. 1134
Drainage of country houses .. 1273
Shoring and underpinning 1407
Scaffolding 1533
Stagings and gantries 1671

PAGE

Brickmaking 1799
Lime and lime burning 1938
Cement manufacture 2071
Cement burning and grinding .. 2189
Processes in cement-making .. 2322
Bricklaying materials 2455
The bonding of brickwork 2591
Constructing brick walls 2720
Brickwork construction 2863
Brick and tile work 2992
Terra-cotta 3107
Masonry 3216
Masonry practice 3335
Arches, vaults, and domes 3462
Stone for special purposes 3579
The tools of the carpenter 3719
Materials in carpentry 3825
Timber in the shop 3957
Wood joints and fastenings .. 4085
Box and balk joints 4200
Carpentry work in roofs 4335
Floors and partitions 4461
Heavy timbering 4597
Fire-resisting buildings 4715
Steel-framed buildings 4855
Roofing work 4983
House joinery 5109
Plastering and house-plumbing .. 5237
The builder's ironwork 5363
Papering, painting, and glazing 5489
Heating, ventilating, and lighting 5603
In business as a builder 5751
The modern sawmill 5871
Cabinetmaking 5999

GROUP 15—NATURAL HISTORY

Botany

Life and her kingdoms 75
The science of a plant 221
How a flower is born 361
Classification of seed-plants .. 483
The warfare of plant life 619
Flowers and their friends 748
How flowers cover the earth .. 883
How plants protect themselves .. 1003
Ferns, horsetails, and mosses .. 1141
The lowest plants 1279
Ravages of plant pests 1413

Zoology

The marvellous pageant of life .. 1537
How animals are classified 1677
Mammals and their food 1807
A survey of the mammals 1943
Weapons and colours of mammals 2097
The classification of birds 2195
Feeding and movement of birds 2333
Courtships and nests of birds .. 2463
The future of bird life 2600
Geography of the animal world .. 2729
Reptiles 2871
Amphibians 2997
Fishes and primitive vertebrates 3113
Shell-fish and sea-shells 3225
Life histories of insects 3345
Net-winged insects and beetles .. 3469
Butterflies and moths 3587
Flies and other insects 3721
Bees, wasps, and ants 3833
Scorpions and spiders 3963
Crabs and their allies 4095
The interest in a worm 4052
Starfishes and sea-urchins 4433
Animals that look like plants .. 4465
The simplest forms of life 4605
A farmer's friends and foes .. 4725

Bacteriology

The study of microbes 4868
The activity of bacteria 4997
How we use microbes 5127

GROUP 16—ELECTRICITY

The electric age 83
Generating electric current .. 229
Types of electric cells 367
Electro-magnets 492
The electric circuit 625
Electric measurement 757
Faraday's discoveries 888
The dynamo 1007
The dynamo 1149
The alternator 1284

PAGE

The electric motor 1417
The transformer 1544
Three-phase currents 1681
Electric tramways 1813
Electric railways 1949
Systems of supply 2082
Electric power stations 2203
Arc lamps 2339
Glow lamps 2467
Electricity meters 2605
Electric heating 2733
The electric furnace 2875
Electric accumulators 3001
Electrolysis 3119
Electroplating 3230
Electricity at rest 3349
Electric oscillations 3473
Electric waves 3592
The nature of electricity 3724
Electrons 3839
The electrical engineer 3966
Practical telegraphy 4100
Sending telegrams 4210
Telegraph apparatus 4346
Morse sounder and relay 4467

Telegraphy and Telephony

Wheatstone's A B C system .. 4607
Many telegrams on one wire .. 4732
The amazing telegraph 4872
Central telegraph office 5002
Transmission of speech 5129
Central energy systems 5252
Telephone traffic marvels 5372
Pole, wire, and underground work 5520
Cable making and laying 5613

Wireless

Wireless telegraphy 5757
Receiving stations 5893
Continuous waves and telephony 6013

GROUP 17—MUSIC

The theory of music 88
The whole language of music .. 235
Harmony and chord-making .. 373
A study of inversions 498
Figured bass and counterpoint .. 629
Tonic-sol-fa system 761, 891
Transposition 1013
The pianoforte 1154
How to produce sound 1291
Position of the hands 1423
Scale playing 1549
Phrasing 1686
Pianoforte practice 1819
The violin 1954
Violin practice 2087
The positions 2209
Advanced violin practice 2342
Violin bowing 2471
The viola 2609
The violoncello 2736
The double-bass 2878
The harp 3004
Harp practice 3122, 3232
The guitar and zither 3352
The organ 3476, 3597
Harmonium and American organ 3727
Harmonium practice 3842
Accordion and concertina 3968
Fife, flute, and ocarina 4105
The clarionet 4216
Mandoline, banjo, and autoharp 4349
Oboe and bassoon 4470
The bagpipes 4609
Sarrusophones and saxhorns .. 4736
Euphonium and bombardon .. 4877
Saxophones and trombones .. 5006
Trumpet, cornet, and horn .. 5134
Percussion instruments and bells 5260
Orchestration 5383
Orchestras and choirs 5508
How to sing 5622
Singing practice 5764
Articulation and phrasing 5900
Piano and organ building 6020

GROUP 18—MANUFACTURES

The textile industries 93
Textile supplies and markets .. 240
Textile products 377
The sources of raw cotton 502
Supply and treatment of wool .. 633

PAGE

Hair and rags 765
Silk—the queen of fibres 897
The bast fibres 1017
Fibres under the microscope 1157, 1205
Testing fibres and fabrics 1426
The first textile machines 1553
Cotton-spinning 1691
Treatment of cotton yarn 1824
Preparing for cotton-weaving 1959
Cotton-weaving: looms 2091
Wool-combing 2213
Worsted and woollen spinning 2347
Silk throwing and spinning 2476
Flax, jute, and hemp spinning 2613
Designs and designers 2740
Carpets and felt 2883
Floorcloth and linoleum 3007
Hosiery and lace 3127
Cloth finishing and printing 3239
The making of twine and rope 3359
Leather manufacture 3482
Chrome tanning 3602
Currying 3733
Leather belting 3848
Boot and shoe manufacture 3973, 4109
Saddlery and harness making 4223
Glass and glass-making 4357
Paper-making 4481
Hand and machine made papers 4615
Pottery manufacture 4744
Rubber 4881, 5015
Tobacco and its manufacture 5145
Mills and milling 5272
Bread and biscuit making 5393
Cane sugar and its manufacture 5520
Beet sugar and its manufacture 5629
British fisheries 5776
Food preservation 5905
Beverages 6031

GROUP 19—ASTRONOMY

The shining heavens 99
The earth's daily round 244
Laws of the universe 381
Measuring the heavens 507
The measurement of time 639
The solar system 769
Mercury, Venus, and the earth 903
The story of the moon 1021
Earth's outer neighbours 1161
Comets and shooting stars 1299
The fixed stars 1431
The theory of the universe 1557

Geology

The making of the earth 1696
How to know minerals 1828
The study of rocks 1965
The oldest rocks 2096
The sedimentary rocks 2219
The earth's internal forces 2351
Earthquake influences 2480
The shaping of the land 2616
Action of flowing water and ice 2745
Geological work of the sea 2886
The earth's story in the rocks 3009
The earth's geological record 3132
The story of the rocks 3245
Earth's first inhabitants 3363
The beginning of bird life 3489
The geological story of man 3609

Archæology

Excavation in Egypt 3739
The discovery of Babylon 3857
The bygone power of Crete 3981
With the spade in Italy 4117
The antiquities of India 4231

GROUP 20—MECHANICAL ENGINEERING

The making of machines 105
A study of applied mechanics 247
Forces in construction 385
The stability of structures 510
Stress diagrams for beams 645
Steel-framed structures 775
Stresses in roof trusses 909
Elements of machines 1025
Mechanical elements applied 1166
Friction and its applications 1303
Hydrostatics 1435
Suction and force pumps 1563
Applications of hydrostatics 1702
More hydrostatic applications 1833

ERRATA—CORRECTIONS IN THE SEVEN VOLUMES OF THE EDUCATOR

VOLUME 1

PAGE

5 line 2. For "what," read "which."

9 Heading. For "daily," read "annual."

70 Picture is upside down.

232 col. 1, line 3. For 35,000,000, read 8,750,000.

359 Szerelmey's Stone Liquid. See note p. 1277, col. 2.

471 col. 2. At end of second paragraph, for "22 seconds every century," read "one-hundredth of a second in a century." See page 1697, col. 1.

698 col. 2, last paragraph. Read "We have noticed that the fat is formed into a soapy emulsion," etc. Delete "An emulsion is . . . an alkali."

VOLUME 2

1008 col. 2, par. 3, line 6. For "gliding," read "sliding."

1012 col. 1. Black type. For "Magnet circuit," read "Magnetic circuit."

1075 col. 2, Devon and Cornwall, line 8. Read "to grow up. At Axminster, in South Devon, long ago famous for its carpets, the most important industry is the making of toilet brushes and similar goods."

1096 col. 2, par. 3. Read "Davy obtained sodium by passing a very powerful current of electricity through the caustic soda (NaOH). The metal is now prepared in a different manner by electrolysis of fused caustic soda, or of the mixed chlorides of sodium, potassium, and strontium."

1149 col. 2, line 3. Read "a much larger number of slots."

1150 col. 2, line 18. Read "No. 1 and" not "in."

1152 col. 2, line 13. Read "RPM÷60."

1200 col. 2, No. 12. For "5 mls. 5 fur. 10 chains," read "5 mls. 5 fur. 7 chains."

col. 2. Examples 12, No. 2. Read

$$21\ 923636 - 9{\cdot}3893 = 12{\cdot}534297702743247$$

1229 col. 3, par. 3. Delete "with tin it forms bronze."

1289 Fig. 91. Replace "C" by "I."

1290 col. 1, line 1. For "95°," read "85°."

col. 2. In the tables, replace "C" by "I."

1316 col. 2, Ex. XIII. Vocabulary. For "to dine—*Cenar*," read "to lunch—*Comer*." Sentence 12: "I have not lunched yet."

1402 col. 2. Delete reference to "Plex" Sealing Machine.

1426 col. 2, black type. Read "Acid Test for Wool and Silk."

1580 col. 2. Key to Ex. XIII. Sentence 13. For "cenado," read "comido."

1787 col. 2. Delete reference to Sleeper, the Boston Humbug. His book has been proved to be a clever forgery.

PAGE

1851 col. 1, line 17. For "6 in.," read "6 ft."

VOLUME 3

2036 col. 2, line 2. "For "Severn," read "Avon."

VOLUME 4

3053 col. 1. Alberta and Saskatchewan, line 3. For "states," read "provinces."

3066 The table assumes that milk is divided into whey, buttermilk, etc., in the course of dairying, and consists of water, fat, casein, sugar, and ash. Of the water, 78·9 per cent. goes to the whey, 14 per cent. to the buttermilk, and so on. Similarly for the other columns.

3076 col. 1. For "Fernando," read "Hernando."

3182 col. 2, line 33. For "months," read "chapters."

3407 col. 2, last line. Read "Santiago del Estero."

3417 col. 2, line 15. For "1500 litres," read "1500 grams."

VOLUME 5

3837 The top picture is upside down.

3868 col. 2, line 8. Read "Rinde"

3926 col. 1, line 25. For "Bunan Varilla," read "Bunau Varilla."

4287 col. 2. Four lines from bottom. For "magnetism," read "magnesium."

4304 col. 1, lines 7, 8, 9. Read respectively "12A, 12B, 12C."

4306 fig. 12. The doorplate C should be shown attached to A, not B. The door could not open as shown.

VOLUME 6

4539 col. 1, line 6. Frenchman.

4686 fig. 3. For "Hydraulic Cranes," read "Hydraulic Presses."

4813 fig. 9. For "Crankpins," read "a crankshaft."

4816 fig. 12. Delete "Rear axle with."

5014 fig. 12. Read "Three-Roll Calender."

5117 last line but one. Read "but tend rather."

5214 col. 1, line 11. For "John," read "Joseph."

VOLUME 7

5432 col. 2, line 6. For "Indria," read "Idria."

5567 col. 2, line 23, For "pinnerettes," read "spinnerettes." Line 30, "liquid."

5807 col. 2, line 17, for "1904," read "1912"

5896 fig. 17. Read "One coil transformer."

5932 col. 2, under Cotton. Read "21,648,000 centals came from the United States, Egypt supplying 4,912,000 centals."

GENERAL INDEX TO THE SELF-EDUCATOR

The SELF-EDUCATOR is paged continuously through all its volumes, and the first and last pages in each volume are stamped on the backs of the volumes to facilitate instant reference. It is thus practically as easy to refer to any page in this seven-volume work as if it were a single volume.

This index is entirely alphabetical, and is arranged on the simplest possible lines. As far as is practicable, the grouping system has been avoided, in order that words might be given their proper place in the alphabet. Thus DYNAMO should be looked for under "D," and not under ELECTRICITY, though many words less familiar in common language are more conveniently placed under the general heading of ELECTRICITY. Chemical compounds are indexed thus, COPPER-SULPHATE, rather than SULPHATE OF COPPER. Unfamiliar minerals are given in the table on pages 4000-4014. Animals are also indexed under English in preference to Latin names.

Compound words and phrases are reckoned as one word, the order being, say—ACID, ACID EGG, ACIDITY, ACID LUTE, and so on. Parts of speech should be looked for under their respective languages: Verb in Latin, for example, under LATIN; adjective in French, under FRENCH, and so on. Figures in italics indicate illustrations.

Where several pages or chapters are devoted to one subject, the first page of the chapter only is indexed, but the arrangement of the EDUCATOR enables the chapters to be found with ease.

Technical terms and phrases not indexed are explained in the special dictionaries appearing in the sixty-four pages following page 6153.

The bibliography of 4000 books on all subjects embraced in the EDUCATOR is not indexed, as the arrangement of the books enables the reader to find quite easily any subject he wishes to consult.

The Editor offers an apology for any lack of completeness that may appear when the full work is compared with the promise with which it set out. Built up in parts as it appeared, and covering two years in its growth, the EDUCATOR shared in the general destruction that came upon Europe when the German Emperor walked out of civilisation. With a depleted staff, and in face of unparalleled difficulties that need not be explained, it became necessary to modify certain departments of the EDUCATOR, and a few subjects have received inadequate treatment. The Editor apologises for this misfortune, confident that it will be accepted as a minor part of the common sacrifice on the altar of civilisation and human liberty.
